

Verify the TCP/IP Configuration on a Macintosh

To verify the TCP/IP configuration on a Macintosh, perform the following tasks using the MacTCP Control Panel (Control Panels are in the Apple menu).

- 1 Check that the Macintosh has the correct IP address. This address is shown in the IP Address box:

- 2 Click the **More...** button to display the next MacTCP dialog box:

- 3 Configure 255.255.255.255 as the IP address of the DNS server.
- 4 Configure the domain name to be a period (.).
- 5 After you have configured the router, set the default gateway to the router's IP address.

If you change any of these parameters from previous settings, you must restart the Macintosh.
