

Set Up the Router

To set up the router, perform the following tasks:

- 1 Plug your router into a power socket.
- 2 Power on the router.
- 3 Make sure that your PC and the router are connected to each other by an Ethernet cable.
- 4 If your router was previously configured, this configuration must be erased prior to using ClickStart. To erase an existing configuration, connect a terminal to the router's console port and use the **set defaults** command to erase the existing configuration file. If you need to save the existing configuration, you can use the **upload** command to move the current configuration to your PC before you initiate the **set defaults** command. Then use the Setup form to configure the router.
