

## Interface Configuration Commands

---

This chapter contains the commands used to configure nonprotocol-specific interface features. The commands are in alphabetical order. For hardware technical descriptions and for information about installing the communication server interfaces, refer to the hardware installation and maintenance publication for your product.

For interface configuration tasks and examples, refer to the *Access and Communication Servers Configuration Guide*.

## backup delay

To define how much time should elapse before a secondary line is set up or taken down after a primary line transition, use the **backup delay** interface configuration command. Use the **no** form of this command to remove the definition.

```
backup delay {enable-delay | never} {disable-delay | never}
no backup delay {enable-delay | never} {disable-delay | never}
```

### Syntax Description

<i>enable-delay</i>	Integer argument that specifies the delay in seconds after the primary line goes down before the secondary line is activated
<i>disable-delay</i>	Integer argument that specifies the delay in seconds after the primary line goes up before the secondary line is deactivated
<b>never</b>	Keyword that is specified to prevent the secondary line from being activated or deactivated

### Default

A secondary line is never activated nor deactivated.

### Command Mode

Interface configuration

### Usage Guidelines

When a primary line goes down, the communication server delays the number of seconds defined by the *enable-delay* argument before enabling the secondary line. If, after the delay period, the primary line is still down, the secondary line is activated.

When a primary line comes back up, the communication server will delay by the number of seconds defined by the *disable-delay* argument.

In cases where there are spurious signal disruptions that might appear as intermittent lost carrier signals, it is recommended that some delay be enabled before activating and deactivating a secondary.

The interval configured with the **backup delay** command does not affect the operation of the **backup load** command.

### Example

The following example sets a 10-second delay on deactivating the secondary line; however, the line is activated immediately:

```
interface serial 0
 backup delay 0 10
```

## backup interface

To configure the serial interface as a secondary, or dial backup line, use the **backup interface** interface configuration command. Use the **no** form of this command with the appropriate serial port designation to turn this feature off.

```
backup interface interface-name  
no backup interface interface-name
```

### Syntax Description

*interface-name or type* Serial port to be set as the secondary interface line

### Default

None

### Command Mode

Interface configuration

### Example

The following example sets serial interface 1 as the backup line to serial interface 0:

```
interface serial 0  
  backup interface serial 1
```

### Related Command

**down-when-looped**

## backup load

To set the traffic load thresholds for dial backup service, use the **backup load** interface configuration command. Use the **no** form of this command to remove the setting.

```
backup load {enable-threshold | never} {disable-load | never}
no backup load {enable-threshold | never} {disable-load | never}
```

### Syntax Description

<i>enable-threshold</i>	Integer argument that specifies a percentage of the primary line's available bandwidth
<i>disable-load</i>	Integer argument that specifies a percentage of the primary line's available bandwidth
<b>never</b>	Keyword that sets the secondary line to never be activated due to load

### Default

The secondary line is never activated due to load.

### Command Mode

Interface configuration

### Usage Guidelines

When the transmitted or received load on the primary line is greater than the value assigned to the *enable-threshold* argument, the secondary line is enabled.

When the transmitted load on the primary line plus the transmitted load on the secondary line is less than the value entered for the *disable-load* argument, and the received load on the primary line plus the received load on the secondary line is less than the value entered for the *disable-load* argument, the secondary line is disabled.

If the **never** keyword is used instead of an *enable-threshold* value, the secondary line is never activated because of load. If the **never** keyword is used instead of an *disable-load* value, the secondary line is never deactivated because of load.

### Example

The following example sets the traffic load threshold to 60 percent on the primary line. When that load is exceeded, the secondary line is activated, and will not be deactivated until the combined load is less than 5 percent of the primary bandwidth.

```
interface serial 0
 backup load 60 5
```

## bandwidth

To set a bandwidth value for an interface, use the **bandwidth** interface configuration command. Use the **no** form of this command to restore the default values.

**bandwidth** *kilobits*  
**no bandwidth**

### Syntax Description

<i>kilobits</i>	Intended bandwidth in kilobits per second. For a full bandwidth DS3, enter the value 44736.
-----------------	---

### Default

Default bandwidth values are set during startup.

### Command Mode

Interface configuration

### Usage Guidelines

Bandwidth values can be displayed with the EXEC command **show interfaces**.

The **bandwidth** command sets an informational parameter only; you cannot adjust the actual bandwidth of an interface with this command. For some media, such as Ethernet, the bandwidth is fixed; for other media, such as serial lines, you can change the actual bandwidth by adjusting hardware. For both classes of media, you can use the **bandwidth** configuration command to communicate the current bandwidth to the higher-level protocols.

Additionally, IGRP uses the minimum path bandwidth to determine a routing metric. The TCP protocol adjusts initial retransmission parameters based on the apparent bandwidth of the outgoing interface.

At higher bandwidths, the value you configure with the **bandwidth** command is not what is displayed by the **show interface** command. The value shown is that used in IGRP updates and also used in computing load.

---

**Note** This is a routing parameter only; it does not affect the physical interface.

---

### Example

The following example sets the full bandwidth for DS3 transmissions:

```
interface serial 0
bandwidth 44736
```

# clear counters

To clear the interface counters, use the **clear counters** EXEC command.

```
clear counters [type number]
```

## Syntax Description

- type* (Optional) Specifies the interface type; it is one of the keywords listed in Table 6-1.
- number* (Optional) Specifies the interface counter displayed with the **show interfaces** command.

Table 6-1 Clear Counters Interface Type Keywords

Keyword	Interface Type
async	Asynchronous serial interface
dialer	Dialer interface
ethernet	Ethernet interface
loopback	Loopback interface
null	Null interface
serial	Synchronous serial interface
tokenring	Token Ring interface
tunnel	Tunnel interface

## Command Mode

EXEC

## Usage Guidelines

This command clears all the current interface counters from the interface unless the optional arguments *type-keyword* and *number* are specified to clear only a specific interface type (serial, Ethernet, Token Ring, and so on).

---

**Note** This command will not clear counters retrieved using SNMP, but only those seen with the EXEC **show interface** command.

---

## Example

The following example illustrates how to clear all interface counters:

```
cs# clear counters
```

## Related Command

**show interfaces**

## clear interface

To reset the hardware logic on an interface, use the **clear interface** EXEC command.

**clear interface** *type number*

### Syntax Description

*type* Specifies the interface type; it is one of the keywords listed in Table 6-2.

*number* Specifies the port, connector, or interface card number.

**Table 6-2 Clear Interface Type Keywords**

Keyword	Interface Type
<b>async</b>	Asynchronous serial interface
<b>ethernet</b>	Ethernet interface
<b>loopback</b>	Loopback interface
<b>null</b>	Null interface
<b>serial</b>	Synchronous serial interface
<b>tokenring</b>	Token Ring interface
<b>tunnel</b>	Tunnel interface

### Command Mode

EXEC

### Usage Guidelines

Under normal circumstances, you do not need to clear the hardware logic on interfaces.

### Example

```
cs# clear interface async 1
```

## clear line

To return a line to its idle state, enter the **clear line** privileged EXEC command at the system prompt.

**clear line** *line-number*

### Syntax Description

*line-number*      Asynchronous line port number assigned with the **interface async** command

### Command Mode

Privileged EXEC

### Usage Guidelines

Normally, this command returns the line to its conventional function as a terminal line, with the interface left in a “down” state.

### Example

The following example shows how to use the **clear line** command to return serial interface 5 to its idle state:

```
clear line 5
```

## clockrate

To configure the clock rate for appliques (connector hardware) on the serial interface of the MCI and SCI cards to an acceptable bit rate, use the **clockrate** interface configuration command. Use the **no** form of this command to remove the clock rate if you change the interface from a DCE to a DTE device.

**clockrate** *bps*  
**no clockrate**

### Syntax Description

<i>bps</i>	Desired clock rate in bits per second: 1200, 2400, 4800, 9600, 19200, 34800, 56000, 64000, 72000, 125000, 148000, 500000, 800000, 1000000, 1300000, 2000000, or 4000000
------------	---

### Default

No clock rate

### Command Mode

Interface configuration

### Usage Guidelines

Be aware that the fastest speeds might not work if your cable is too long, and that speeds faster than 148,000 bits per second are too fast for RS-232 signaling. It is recommended that you only use the synchronous serial RS-232 signal at speeds up to 64,000 bits per second. To permit a faster speed, use an RS-449 or V.35 applique.

### Example

The following example sets the clock rate on the first serial interface to 64,000 bits per second:

```
interface serial 0
clockrate 64000
```

## compress predictor

To configure point-to-point software compression for a LAPB, use the **compress predictor** interface configuration command. Use the **no** form of this command to disable compression.

**compress predictor**  
**no compress predictor**

### Syntax Description

This command has no arguments or keywords.

### Default

Disabled

### Command Mode

Interface configuration

### Usage Guidelines

You can configure point-to-point software compression for all LAPB encapsulations. Compression reduces the size of LAPB frames via lossless data compression. The compression algorithm used is a predictor algorithm (the RAND compression algorithm), which uses a compression dictionary to predict what the next character in the frame will be.

Compression is performed in software and can significantly affect system performance. We recommend that you disable compression if CPU load exceeds 65%. To display the CPU load, use the **show process cpu EXEC** command.

Compression requires that both ends of the serial link be configured to use compression. You should never enable compression for connections to a public data network.

---

**Note** The best performance data compression algorithms adjust their compression methodology as they discover patterns in the data. For this to work well, no data can be lost, so the compression algorithm is run over LAPB to ensure that everything is sent in order, with no missing data and no duplicate data.

---

If the majority of your traffic is already compressed files, you should not use compression.

When using compression, you should adjust the MTU for the serial interface and the LAPB N1 parameter as shown in the example to avoid informational diagnostics regarding excessive MTU or N1 sizes.

### Example

The following example enables compression on serial interface 0 for a LAPB link:

```
interface serial 0
encapsulation lapb
compress predictor
mtu 1509
lapb nl 12072
```

### Related Commands

A dagger (†) indicates that the command is documented in another chapter.

**encapsulation lapb** †  
**encapsulation lapb-dce** †  
**encapsulation multi-lapb** †  
**encapsulation multi-lapb-dce** †  
**encapsulation x25** †  
**show compress**  
**show processes** †

## delay

To set a delay value for an interface, use the **delay** interface configuration command. Use the **no** form of this command to restore the default delay value.

**delay** *tens-of-microseconds*  
**no delay**

### Syntax Description

<i>tens-of-microseconds</i>	Integer that specifies the delay in tens of microseconds for an interface or network segment
-----------------------------	--

### Default

You can display default delay values with the EXEC command **show interfaces**.

### Command Mode

Interface configuration

### Example

The following example sets a 30,000-microsecond delay on serial interface 3:

```
interface serial 3
delay 30000
```

### Related Command

**show interfaces**

## description

To add a description to an interface configuration, use the **description** interface configuration command. Use the **no** form of this command to remove the description.

**description** *string*  
**no description**

### Syntax Description

*string*                      Comment or description to help you remember what is attached to this interface

### Default

None

### Command Mode

Interface configuration

### Usage Guidelines

The **description** command is meant solely as a comment to be put in the configuration to help you remember what certain interfaces are used for. The description appears in the output of the following EXEC commands: **show configuration**, **show interfaces**, and **write terminal**.

### Example

The following example describes a 3174 controller on serial interface 0:

```
interface serial 0
description 3174 Controller for test lab
```

### Related Commands

A dagger (†) indicates that the command is documented in another chapter.

**show configuration** †  
**show interfaces**  
**write terminal** †

## down-when-looped

To configure an interface to inform the system it is down when loopback is detected, use the **down-when-looped** interface configuration command.

**down-when-looped**

### Syntax Description

This command has no arguments or keywords.

### Default

Disabled

### Command Mode

Interface configuration

### Usage Guidelines

This command is valid for PPP encapsulation on serial and HSSI interfaces.

When an interface has a backup interface configured, it is often desirable that the backup interface be enabled when the primary interface is either down or in loopback. By default, the backup is only enabled if the primary interface is down. By using the **down-when-looped** command, the backup interface will also be enabled if the primary interface is in loopback.

If testing an interface with the loopback command, or by placing the DCE into loopback, **down-when-looped** should not be configured; otherwise packets will not be transmitted out the interface that is being tested.

### Example

In the following example, serial interface 0 is configured for PPP encapsulation. It is then configured to let the system know that it is down when in loopback mode.

```
interface serial 0
encapsulation ppp
down-when-looped
```

### Related Commands

**backup interface**

**loopback**

## early-token-release

To enable early token release, use the **early-token-release** interface configuration command. Use the **no** form of this command to disable this feature.

**early-token-release**  
**no early-token-release**

### Syntax Description

This command has no arguments or keywords.

### Default

Disabled

### Command Mode

Interface configuration

### Usage Guidelines

This feature helps to increase the total bandwidth of the Token Ring. Early token release is a method whereby the Token Ring interfaces can release the token back onto the ring immediately after transmitting rather than waiting for the frame to return.

The CSC-R16M, CSC-2R, and CSC-1R cards support early token release.

### Example

The following example enables the use of early token release on Token Ring interface 1:

```
interface tokenring 1
early-token-release
```

## encapsulation

To set the encapsulation method used by the interface, use the **encapsulation** interface configuration command.

**encapsulation** *encapsulation-type*

### Syntax Description

*encapsulation-type*      Encapsulation type. See Table 6-3 for a list of supported encapsulation types.

**Table 6-3 Encapsulation Types**

Keyword	Encapsulation Type
<b>arpa</b>	This encapsulation uses a 16-bit protocol type code.
<b>bfx25</b>	Blacker Front End Encryption X.25 operation (for serial interface)
<b>ddnx25-dce</b>	DDN X.25 DCE operation (for serial interface)
<b>ddnx25</b>	DDN X.25 DTE operation (for serial interface)
<b>frame-relay</b>	Frame Relay (for serial interface)
<b>hdlc</b>	High-Level Data Link Control (HDLC) protocol for serial interface. This encapsulation method provides the synchronous framing and error detection functions of HDLC without windowing or retransmission.
<b>sap</b>	IEEE 802.3 encapsulation. In this encapsulation, the type code becomes the frame length for the IEEE 802.2 LLC encapsulation (destination and source Service Access Points and a control byte).
<b>lapb</b>	X.25 LAPB DTE operation (for serial interface)
<b>lapb-dce</b>	X.25 LAPB DCE operation (for serial interface)
<b>multi-lapb</b>	X.25 LAPB multiprotocol DTE operation (for serial interface)
<b>multi-lapb-dce</b>	X.25 LAPB multiprotocol DCE operation (for serial interface)
<b>ppp</b>	Point-to-Point Protocol (PPP) (for serial interface)
<b>smds</b>	Switched Multimegabit Data Services (SMDS) (for serial interface)
<b>snap</b>	IEEE 802.2 Ethernet media. This encapsulation is specified in RFC 1042 and allows Ethernet protocols to run on IEEE 802.2 media.
<b>x25-dce</b>	X.25 DCE operation (for serial interface)
<b>x25</b>	X.25 DTE operation (for serial interface)

### Default

The default depends on the type of interface. For example, an Ethernet interface defaults to ARPA.

### Command Mode

Interface configuration

### Examples

The following example reenables standard Ethernet Version 2.0 encapsulation on Ethernet interface 0:

```
interface ethernet 0
encapsulation arpa
```

The following example sets IEEE 802.3 encapsulation on Ethernet interface 1:

```
interface ethernet 1
encapsulation sap
```

The following example enables PPP encapsulation on serial interface 0:

```
interface serial 0
encapsulation ppp
```

The following example sets IEEE 802.2 encapsulation on Ethernet interface 1:

```
interface ethernet 1
encapsulation snap
```

### Related Commands

A dagger (†) indicates that the command is documented in another chapter.

**keepalive**

**ppp** †

**ppp authentication chap**

**slip** †

## error-threshold

To set the mechanism that protects against packet overload and resulting recount errors on the MCI interface cards, use the **error-threshold** interface configuration command.

**error-threshold** *milliseconds*

### Syntax Description

*milliseconds*                      Frequency at which the error recount will be set in milliseconds

### Default

1000 milliseconds

### Command Mode

Interface configuration

### Example

The following commands set the error recount threshold on Ethernet interface 2 to 10,000 milliseconds:

```
interface ethernet 2
error-threshold 10000
```

## hold-queue

To specify the hold-queue limit of an interface, use the **hold-queue** interface configuration command. Use the **no** form of this command with the appropriate keyword to restore the default values for an interface.

```
hold-queue length {in | out}  
no hold-queue {in | out}
```

### Syntax Description

<i>length</i>	An integer that specifies the maximum number of packets in the queue
<b>in</b>	A keyword that specifies the input queue
<b>out</b>	A keyword that specifies the output queue

### Default

The default input hold-queue limit is 75 packets. The default output hold-queue limit is 40 packets. These limits prevent a malfunctioning interface from consuming an excessive amount of memory. There is no fixed upper limit to a queue size.

### Command Mode

Interface configuration

### Usage Guidelines

The input hold queue prevents a single interface from flooding the network server with too many input packets. Further input packets are discarded if the interface has too many input packets outstanding in the system.

If priority output queueing is being used, the length of the four output queues is set using the **priority-list** global configuration command. The **hold-queue** command cannot be used to set an output hold queue length in this situation.

For slow links, use a small output hold-queue limit. This approach prevents storing packets at a rate that exceeds the transmission capability of the link. For fast links, use a large output hold-queue limit. A fast link may be busy for a short time (and thus require the hold queue), but can empty the output hold queue quickly when capacity returns.

To display the current hold queue setting and the number of packets discarded because of hold queue overflows, use the EXEC command **show interfaces**.

---

**Note** Increasing the hold queue can have detrimental effects on network routing and response times. For protocols that use seq/ack packets to determine round trip times, do not increase the output queue. Dropping packets instead informs hosts to slow down transmissions to match available bandwidth. This is generally better than having duplicate copies of the same packet within the network (which can happen with large hold queues).

---

**Example**

The following example illustrates how to set a small input queue on a slow serial line:

```
interface serial 0
hold-queue 30 in
```

**Related Command**

**show interfaces**

**I**

## ignore-dcd

Use the **ignore-dcd** interface configuration command to configure the serial interface to monitor the DSR signal (instead of the DCD signal) as the line up/down indicator. Use the **no** form of this command to restore the default behavior.

**ignore-dcd**  
**no ignore-dcd**

### Syntax Description

This command has no arguments or keywords.

### Default

The serial interface, operating in DTE mode, monitors the DCD signal as the line up/down indicator.

### Command Mode

Interface configuration

### Usage Guidelines

This command applies to Quad Serial NIM interfaces on the Cisco 4000 series and Hitachi-based serial interfaces on the Cisco 2500 series and Cisco 3000 series.

When the serial interface is operating in DTE mode, it monitors the Data Carrier Detect (DCD) signal as the line up/down indicator. By default, the attached DCE device sends the DCD signal. When the DTE interface detects the DCD signal, it changes the state of the interface to up.

In some configurations, such as an SDLC multidrop environment, the DCE device sends the Data Set Ready (DSR) signal instead of the DCD signal, which prevents the interface from coming up. Use this command to tell the interface to monitor the DSR signal as the line up/down indicator instead of the DCD signal.

### Example

The following example configures serial interface 0 to monitor the DSR signal as the line up/down indicator:

```
interface serial 0
ignore-dcd
```

# interface

To configure an interface type and enter interface configuration mode, use the **interface** global configuration command.

**interface** *type number*

To configure a subinterface, use the **interface** global configuration command.

**interface** *type number.subinterface-number* [**multipoint** | **point-to-point**]

## Syntax Description

<i>type</i>	Type of interface to be configured. See Table 6-4.
<i>number</i>	Port, connector, or interface card number. The numbers are assigned at the factory at the time of installation or when added to a system, and can be displayed with the <b>show interfaces</b> command.
<i>.subinterface-number</i>	Subinterface number in the range 1 to 4294967293. The <i>number</i> that precedes the period (.) must match the <i>number</i> to which this subinterface belongs.
<b>multipoint</b>   <b>point-to-point</b>	(Optional) Specifies a multipoint or point-to-point subinterface. Default is <b>multipoint</b> .

**Table 6-4 Interface Type Keywords**

Keyword	Interface Type
<b>async</b>	Line used as an asynchronous interface.
<b>dialer</b>	Dialer interface.
<b>ethernet</b>	Ethernet IEEE 802.3 interface.
<b>loopback</b>	Software-only loopback interface that emulates an interface that is always up. It is a virtual interface supported on all platforms. The <i>interface-number</i> is the number of the loopback interface that you want to create or configure. There is no limit on the number of loopback interfaces you can create.
<b>null</b>	Null interface.
<b>serial</b>	Serial interface.
<b>tokenring</b>	Token Ring interface.
<b>tunnel</b>	Tunnel interface; a virtual interface. The <i>interface-number</i> is the number of the tunnel interface that you want to create or configure. There is no limit on the number of tunnel interfaces you can create.

## Default

The default mode for subinterfaces is **multipoint**.

## Command Mode

Global configuration

### Usage Guidelines

Subinterfaces can be configured to support partially meshed Frame Relay networks and multiple IPX encapsulations on LAN media (refer to the *Access and Communication Servers Configuration Guide*).

### Examples

In the following example, serial interface 0 is configured with PPP encapsulation:

```
interface serial 0
encapsulation ppp
```

The following example enables loopback mode and assigns an IP network address and network mask to the interface. The loopback interface established here will always appear to be up:

```
interface loopback 0
ip address 131.108.1.1 255.255.255.0
```

The following example shows how a partially meshed Frame Relay network can be configured. In this example, subinterface serial 0.1 is configured as a multipoint subinterface with three Frame Relay PVCs associated, and subinterface serial 0.2 is configured as a point-to-point subinterface.

```
interface serial 0
encapsulation frame-relay
interface serial 0.1 multipoint
ip address 131.108.10.1 255.255.255.0
frame-relay interface-dlci 42 broadcast
frame-relay interface-dlci 53 broadcast
interface serial 0.2 point-to-point
ip address 131.108.11.1 255.255.0
frame-relay interface-dlci 59 broadcast
```

### Related Commands

A dagger (††) indicates that the command is documented in the *Cisco Access Connection Guide*.

**ppp** ††

**show interfaces**

**slip** ††

## interface dialer

To designate a dialer rotary group leader, use the **interface dialer** global configuration command.

**interface dialer** *interface-number*

### Syntax Description

*interface-number*      Integer that you select to indicate a dialer rotary group in the range 0 to 9

### Default

None

### Command Mode

Global configuration

### Usage Guidelines

Dialer rotary groups allow you to apply a single interface configuration to a set of interfaces. Once the interface configuration is propagated to a set of interfaces, those interfaces can be used to place calls using the standard dial-on-demand criteria. When many destinations are configured, any of these interfaces can be used for outgoing calls.

Dialer rotary groups are useful in environments that require many calling destinations. Only the rotary group needs to be configured with all of the **dialer map** commands. The only configuration required for the interfaces is the **dialer rotary-group** command indicating that each interface is part of a dialer rotary group.

Although a dialer rotary group is configured as an interface, it is not a physical interface. Instead it represents a group of interfaces. Any number of dialer groups can be defined.

Interface configuration commands entered after the **interface dialer** command will be applied to all physical interfaces assigned to specified rotary group.

### Example

The following example identifies dialer interface 1 as the dialer rotary group leader. Dialer interface 1 is not a physical interface, but represents a group of interfaces. The interface configuration commands that follow apply to all interfaces included in this group.

```
interface dialer 1
encapsulation ppp
dialer in-band
dialer map ip 131.108.2.5 username YYY 14155553434
dialer map ip 131.126.4.5 username ZZZ
```

### Related Command

A dagger (†) indicates that the command is documented in another chapter.

**dialer rotary-group** †

## keepalive

Use the **keepalive** interface configuration command to set the keepalive timer for a specific interface. The **no keepalive** command turns off keepalives entirely.

**keepalive** [*seconds*]  
**no keepalive** [*seconds*]

### Syntax Description

*seconds* (Optional) Unsigned integer value greater than 0. The default is 10 seconds.

### Default

10 seconds

### Command Mode

Interface configuration

### Usage Guidelines

You can configure the keepalive interval, which is the frequency at which the communication server sends messages to itself (Ethernet and Token Ring) or to the other end (serial), to ensure a network interface is alive. The interval in previous software versions was 10 seconds; it is now adjustable in 1-second increments down to 1 second. An interface is declared down after three update intervals have passed without receiving a keepalive packet.

Setting the keepalive timer to a low value is very useful for rapidly detecting Ethernet interface failures (transceiver cable disconnecting, cable unterminated, and so on).

A typical serial line failure involves losing Carrier Detect (CD). Since this sort of failure is typically noticed within a few milliseconds, adjusting the keepalive timer for quicker routing recovery is generally not useful.

---

**Note** When adjusting the keepalive timer for a very low bandwidth serial interface, large datagrams can delay the smaller keepalive packets long enough to cause the line protocol to go down. You might need to experiment to determine the best value.

---

### Example

The following example sets the keepalive interval to 3 seconds:

```
interface ethernet 0
keepalive 3
```

# loopback

To diagnose equipment malfunctions between an interface and a device, use the **loopback** interface configuration command. Use the **no** form of this command to disable the test.

**loopback**  
**no loopback**

## Syntax Description

This command has no arguments or keywords.

## Default

Disabled

## Command Mode

Interface configuration

## Usage Guidelines

On MCI and SCI serial interface cards, the loopback functions when a CSU/DSU or equivalent device is attached to the communication server. The **loopback** command loops the packets through the CSU/DSU to configure a CSU loop, when the device supports this feature.

On the MCI and MEC Ethernet cards, the interface receives back every packet it sends when the **loopback** command is enabled. Loopback operation has the additional effect of disconnecting network server functionality from the network.

On all Token Ring interface cards (except the 4-megabit CSC-R card), the interface receives back every packet it sends when the **loopback** command is enabled. Loopback operation has the additional effect of disconnecting network server functionality from the network.

## Example

The following example configures the loopback test on Ethernet interface 4:

```
interface ethernet 4
loopback
```

## Related Command

**down-when-looped**

## loopback dte

To loop packets to DTE internally within the CSU/DSU at the DTE interface, use the **loopback** interface configuration command. Use the **no** form of this command to remove the loop.

**loopback dte**  
**no loopback dte**

### Syntax Description

This command has no arguments or keywords.

### Default

Disabled

### Command Mode

Interface configuration

### Example

The following example configures the loopback test on the DTE interface:

```
interface serial 1
 loopback dte
```

## loopback line

To loop packets completely through the CSU/DSU to configure the CSU loop, use the **loopback line** interface configuration command. Use the **no** form of this command to remove the loop.

**loopback line**  
**no loopback line**

### Syntax Description

This command has no arguments or keywords.

### Default

Disabled

### Command Mode

Interface configuration

### Usage Guidelines

This command is useful for testing the DCE device (CSU/DSU) itself.

To show interfaces currently in loopback operation, use the **show interfaces loopback EXEC** command.

### Example

The following example configures the loopback test on the DCE device:

```
interface serial 1
 loopback line
```

### Related Command

**show interfaces loopback**

## loopback remote

To loop packets completely through the CSU/DSU, over the DS3 link, to the remote CSU/DSU and back, use the **loopback remote** interface configuration command. Use the **no** form of this command to remove the loop.

**loopback remote**  
**no loopback remote**

### Syntax Description

This command has no arguments or keywords.

### Default

Disabled

### Command Mode

Interface configuration

### Usage Guidelines

This command is useful for testing the DCE device (CSU/DSU) itself.

This command applies only when the device supports the remote function. It is used for testing the data communication channels. The loopback usually is performed at the line port, rather than the DTE port, of the remote CSU/DSU.

To show interfaces currently in loopback operation, use the **show interfaces loopback EXEC** command.

### Example

The following example configures a remote loopback test:

```
interface serial 0
loopback remote
```

### Related Command

**show interfaces loopback**

## mop enabled

To enable an interface to support the Maintenance Operation Protocol (MOP), use the **mop enabled** interface configuration command. Use the **no** form of this command to disable MOP on an interface.

**mop enabled**  
**no mop enabled**

### Syntax Description

This command has no arguments or keywords.

### Default

Enabled by default on Ethernet interfaces and disabled on all other interfaces.

### Command Mode

Interface configuration

### Example

In the following example, MOP is enabled for serial interface 0:

```
interface serial 0
mop enabled
```

### Related Commands

A dagger (†) indicates that the command is documented in another chapter.

**mop sysid**  
**mop retransmit-timer** †  
**mop retries** †

## mop sysid

To enable an interface to send out periodic Maintenance Operation Protocol (MOP) system identification messages, use the **mop sysid** interface configuration command. Use the **no** form of this command to disable MOP message support on an interface.

**mop sysid**  
**no mop sysid**

### Syntax Description

This command has no arguments or keywords.

### Default

Enabled

### Command Mode

Interface configuration

### Usage Guidelines

You can run MOP without having the background system ID messages sent. This lets you use the MOP remote console, but does not generate messages used by the configurator.

### Example

In the following example, serial interface 0 is enabled to send MOP system identification messages:

```
interface serial0
mop sysid
```

### Related Commands

A dagger (†) indicates that the command is documented in another chapter.

**mop device-code** †  
**mop enabled**

## mtu

To adjust the maximum packet size or maximum transmission unit (MTU) size, use the **mtu** interface configuration command. Use the **no** form of this command to restore the MTU value to its original default value.

**mtu** *bytes*  
**no mtu**

### Syntax Description

*bytes*                      Desired size in bytes

### Default

Table 6-5 lists default MTU values according to media type.

**Table 6-5**    Default Media MTU Values

Media Type	Default MTU
Ethernet	1500
Serial	1500
Token Ring	4464

### Command Mode

Interface configuration

### Usage Guidelines

Each interface has a default maximum packet size or maximum transmission unit (MTU) size. This number generally defaults to the largest size possible for that type interface. On serial interfaces, the MTU size varies, but cannot be set smaller than 64 bytes.

---

**Note** Changing the MTU value with the **mtu** interface configuration command can affect values for the protocol-specific versions of the command (**ip mtu** for example). If the values specified with the **ip mtu** interface configuration command is the same as the value specified with the **mtu** interface configuration command, and you change the value for the **mtu** interface configuration command, the **ip mtu** value automatically matches the new **mtu** interface configuration command value. However, changing the values for the **ip mtu** configuration commands has no effect on the value for the **mtu** interface configuration command.

---

### Example

The following example specifies an MTU of 1000 bytes:

```
interface serial 1
mtu 1000
```

### **Related Commands**

A dagger (†) indicates that the command is documented in another chapter.

**encapsulation smds** †

**ip mtu** †

## ppp authentication

To enable Challenge Handshake Authentication Protocol (CHAP) or Password Authentication Protocol (PAP) on a serial interface, use the **ppp authentication** interface configuration command. Use the **no** form of this command to disable this encapsulation.

```
ppp authentication {chap | pap} [if-needed]
no ppp authentication
```

### Syntax Description

<b>chap</b>	Enables CHAP on a serial interface.
<b>pap</b>	Enables PAP on a serial interface.
<b>if-needed</b>	(Optional) Do not perform CHAP or PAP authentication if user has already provided authentication. This option is available only on asynchronous interfaces.

### Default

Disabled

### Command Mode

Interface configuration

### Usage Guidelines

Once you have enabled CHAP or PAP, the local communication server requires a password from remote devices. If the remote device does not support CHAP or PAP, no traffic will be passed to that device.

If you are using **autoselect** on a tty line, you will probably want to use the **ppp authentication** command to turn on PPP authentication for the corresponding interface.

When you specify the **if-needed** option, PPP authentication will not be required when the user has already provided authentication. This option is useful in conjunction to the **autoselect** command.

### Example

The following example enables CHAP on asynchronous interface 4:

```
interface async 4
 encapsulation ppp
 ppp authentication chap
```

### Related Commands

A dagger (†) indicates that the command is documented in another chapter.

```
autoselect†
 encapsulation ppp†
 ppp use-tacacs†
 username†
```

## ppp quality

To enable Link Quality Monitoring (LQM) on a serial interface, use the **ppp quality** interface configuration command. Use the **no** form of this command to disable LQM.

**ppp quality** *percentage*  
**no ppp quality**

### Syntax Description

*percentage* Specifies the link quality threshold. The range is 1 to 100.

### Default

Disabled

### Command Mode

Interface configuration

### Usage Guidelines

The percentages are calculated for both incoming and outgoing directions. The outgoing quality is calculated by comparing the total number of packets and bytes sent to the total number of packets and bytes received by the peer. The incoming quality is calculated by comparing the total number of packets and bytes received to the total number of packets and bytes sent by the peer.

If the link quality percentage is not maintained, the link is deemed to be of poor quality and is taken down. The policy implements a time lag so that the link does not bounce up and down.

### Example

The following example enables LQM on serial interface 0:

```
interface serial 0
encapsulation ppp
ppp quality 80
```

### Related Commands

A dagger (†) indicates that the command is documented in another chapter.

**encapsulation ppp**  
**keepalive** †

## pulse-time

To enable pulsing DTR signal intervals on the serial interfaces, use the **pulse-time** interface configuration command. Use the **no** form of this command to restore the default interval.

**pulse-time** *seconds*  
**no pulse-time**

### Syntax Description

*seconds*                      Integer that specifies the DTR signal interval in seconds

### Default

0 seconds

### Command Mode

Interface configuration

### Usage Guidelines

When the serial line protocol goes down (for example, because of loss of synchronization) the interface hardware is reset and the DTR signal is held inactive for at least the specified interval. This function is useful for handling encrypting or other similar devices that use the toggling of the DTR signal to resynchronize.

### Example

The following example enables DTR pulse signals for three seconds on serial interface 0:

```
interface serial 0
pulse-time 3
```

## ring-speed

To set the ring speed for the CSC-1R and CSC-2R Token Ring interfaces, use the **ring-speed** interface configuration command.

**ring-speed** *speed*

### Syntax Description

*speed* Integer that specifies the ring speed, either 4 for 4-Mbps or 16 for 16-Mbps operation

### Default

16-Mbps operation

### Command Mode

Interface configuration

### Usage Guidelines

**Caution** Configuring a ring speed that is wrong or incompatible with the connected Token Ring will cause the ring to beacon, which effectively takes the ring down and makes it nonoperational.

### Example

The following example sets a Token Ring interface ring speed to 4 Mbps:

```
interface tokenring 0
ring-speed 4
```

## scheduler-interval

To control the maximum amount of time that can elapse without running the lowest priority system processes, use the **scheduler-interval** global configuration command. Use the **no** form of this command to restore the default.

**scheduler-interval** *milliseconds*  
**no scheduler-interval**

### Syntax Description

*milliseconds*      An integer that specifies the interval in milliseconds. The minimum interval that you can specify is 500 milliseconds; there is no maximum value.

### Default

The default is to allow high-priority operations to use as much of the central processor as needed.

### Command Mode

Global configuration

### Usage Guidelines

The normal operation of the network server allows the switching operations to use as much of the central processor as is required. If the network is running unusually heavy loads that do not allow the processor the time to handle the routing protocols, give priority to the system process scheduler.

### Example

The following example changes the low-priority process schedule to an interval of 750 milliseconds:

```
scheduler-interval 750
```

# show async status

To list the status of asynchronous interfaces, use the **show async status** EXEC command:

```
show async status
```

## Syntax Description

This command has no arguments or keywords.

## Command Mode

EXEC

## Usage Guidelines

This command shows all asynchronous sessions, whether they are using SLIP or PPP encapsulation.

## Sample Display

The following is sample output from the **show async status** command:

```
CS> show async status

Async protocol statistics:
  Rcvd: 5448 packets, 7682760 bytes
        1 format errors, 0 checksum errors, 0 overrun, 0 no buffer
  Sent: 5455 packets, 7682676 bytes, 0 dropped

      Int           Local           Remote Qd InPack OutPac Inerr  Drops  MTU  Qsz
      ---          -
      1      192.31.7.84      Dynamic  0      0      0      0      0 1500  10
```

Table 6-6 describes significant fields shown in the display.

**Table 6-6 Asynchronous Statistics Display Field Descriptions**

Field	Description
<b>Rcvd</b>	Statistics on packets received.
5548 packets	Packets received.
7682760 bytes	Total number of bytes.
1 format errors	Packets with a bad IP header, even before the checksum is calculated.
0 checksum errors	Count of checksum errors.
0 overrun	Number of giants received.
0 no buffer	Number of packets received when no buffer was available.
<b>Sent</b>	Statistics on packets sent.
5455 packets	Packets sent.
7682676 bytes	Total number of bytes.
0 dropped	Number of packets dropped.
<b>Int</b>	Interface number.
*	Line currently in use.

Field	Description
Local	Local IP address on the link.
Remote	Remote IP address on the link; “Dynamic” indicates that a remote address is allowed but has not been specified; “None” indicates that no remote address is assigned or being used.
Qd	Number of packets on hold queue (Qsz is max).
InPack	Number of packets received.
OutPac	Number of packets sent.
Inerr	Number of total input errors; sum of format errors, checksum errors, overruns and no buffers.
Drops	Number of packets received that would not fit on the hold queue.
MTU	Current maximum transmission unit size.
Qsz	Current output hold queue size.

### Related Command

**interface async**

# show compress

To display compression statistics on a serial interface, use the **show compress** EXEC command.

**show compress**

## Syntax Description

This command has no arguments or keywords.

## Command Mode

EXEC

## Sample Display

The following is sample output from the **show compress** command:

```
cs# show compress

Serial0
uncompressed bytes xmt/rcv 10710562/11376835
1 min avg ratio xmt/rcv 2.773/2.474
5 min avg ratio xmt/rcv 4.084/3.793
10 min avg ratio xmt/rcv 4.125/3.873
no bufs xmt 0 no bufs rcv 0
resets 0
```

Table 6-7 describes the fields shown in the display.

**Table 6-7 Show Compress Field Descriptions**

Field	Description
Serial0	Name and number of the interface
uncompressed bytes xmt/rcv	Total number of uncompressed bytes sent and received
1 min avg ratio xmt/rcv 5 min avg ratio xmt/rcv 10 min avg ratio xmt/rcv	Static compression ratio for bytes sent and received, averaged over 1, 5, and 10 minutes
no bufs xmt	Number of times buffers were not available to compress data being sent
no bufs rcv	Number of times buffers were not available to uncompress data being received
resets	Number of resets

## Related Command

**compress predictor**

## show controllers ethernet

Use the **show controllers ethernet** EXEC command to display information on the Cisco 2500.

**show controllers ethernet** *interface-number*

### Syntax Description

*interface-number*      Interface number of the Ethernet interface.

### Command Mode

EXEC

### Sample Display

The following is sample output from the **show controllers ethernet** command:

```
cs# show controllers ethernet 0

## show controllers mci

Use the **show controllers mci** privileged EXEC command to display all information about the Multiport Communications Interface card. This command displays information the system uses for bridging and routing that is specific to the interface hardware. The information displayed is generally useful for diagnostic tasks performed by technical support personnel only.

**show controllers mci**

### Syntax Description

This command has no arguments or keywords.

### Command Mode

Privileged EXEC

### Sample Display

The following is sample output from the **show controllers mci** command:

```
cs# show controllers mci

MCI 0, controller type 1.1, microcode version 1.8
    128 Kbytes of main memory, 4 Kbytes cache memory
22 system TX buffers, largest buffer size 1520
Restarts: 0 line down, 0 hung output, 0 controller error
Interface 0 is Ethernet0, station address 0000.0c00.d4a6
    15 total RX buffers, 11 buffer TX queue limit, buffer size 1520
    Transmitter delay is 0 microseconds
Interface 1 is Serial0, electrical interface is V.35 DTE
    15 total RX buffers, 11 buffer TX queue limit, buffer size 1520
    Transmitter delay is 0 microseconds
    High speed synchronous serial interface
Interface 2 is Ethernet1, station address aa00.0400.3be4
    15 total RX buffers, 11 buffer TX queue limit, buffer size 1520
    Transmitter delay is 0 microseconds
Interface 3 is Serial1, electrical interface is V.35 DCE
    15 total RX buffers, 11 buffer TX queue limit, buffer size 1520
    Transmitter delay is 0 microseconds
    High speed synchronous serial interface
```

Table 6-8 describes significant fields shown in the display.

**Table 6-8 Show Controllers MCI Field Descriptions**

Field	Description
MCI 0	Card type and unit number (varies depending on card)
controller type 1.1	Version number of the card
microcode version 1.8	Version number of the card's internal software (in read-only memory)
128 Kbytes of main memory	Amount of main memory on the card
4 Kbytes cache memory	Amount of cache memory on the card
22 system TX buffers	Number of buffers that hold packets to be transmitted
largest buffer size 1520	Largest size of these buffers (in bytes)

Field	Description
Restarts	Count of restarts due to the following conditions:
0 line down	Communication line down
0 hung output	Output unable to transmit
0 controller error	Internal error
Interface 0 is Ethernet0	Names of interfaces, by number
electrical interface is V.35 DTE	Line interface type for serial connections
15 total RX buffers	Number of buffers for received packets
11 buffer TX queue limit	Maximum number of buffers in transmit queue
Transmitter delay is 0 microseconds	Delay between outgoing frames
Station address 0000.0c00.d4a6	Hardware address of the interface

---

**Note** The interface type is only queried at startup. If the hardware changes *subsequent* to initial startup, then the wrong type is reported. This has *no* adverse effect on the operation of the software. For instance, if a DCE cable is connected to a dual-mode V.35 applique after the unit has been booted, then the display presented for **show interfaces** incorrectly reports attachment to a DTE device although the software recognizes the DCE interface and behaves accordingly.

---

### Related Command

**tx-queue-limit**

## show controllers serial

Use the **show controllers serial** privileged EXEC command to display information that is specific to the interface hardware. The information displayed is generally useful for diagnostic tasks performed by technical support personnel only.

### show controllers serial

### Syntax Description

This command has no arguments or keywords.

### Command Mode

Privileged EXEC

### Sample Display

Sample output of the **show controllers serial** command:

## show controllers token

To display information about memory management, error counters, and the CSC-1R, CSC-2R, and or CSC-R16M Token Ring interface cards, use the **show controllers token** privileged EXEC command.

### show controllers token

### Syntax Description

This command has no arguments or keywords.

### Command Mode

EXEC

### Usage Guidelines

Depending on the board being used, the output can vary. This command also displays information that is proprietary to Cisco Systems. Thus, the information that **show controllers token** displays is of primary use to Cisco technical personnel. Information that is useful to users can be obtained using the **show interfaces tokenring** command, described later in this chapter.

### Sample Display

The following is sample output of the **show controllers token** command:

```
cs# show controllers token

TR Unit 0 is board 0 - ring 0

state 3, dev blk: 0x1D2EBC, mailbox: 0x2100010, sca: 0x2010000

```

Table 6-9 describes the fields shown in the following line of sample output.

```
TR Unit 0 is board 0 - ring 0
```

Table 6-9 Show Controllers Token Field Descriptions—Part 1

Field	Description
TR Unit 0	Unit number assigned to the Token Ring interface associated with this output
is board 0	Board number assigned to the Token Ring controller board associated with this interface
ring 0	Number of the Token Ring associated with this board

In the following output line, state 3 indicates the state of the board. The rest of this output line displays memory mapping that is of primary use to Cisco engineers.

```
state 3, dev blk: 0x1D2EBC, mailbox: 0x2100010, sca: 0x2010000
```

The following line also appears in **show interface token** output as the address and burned-in address, respectively:

```
current address: 0000.3080.6f40, burned in address: 0000.3080.6f40
```

The following line of output displays buffer management pointers that change by board:

```
current TX ptr: 0xBA8, current RX ptr: 0x800
```

The following line of output indicates the ring status from the controller chip set. This information is used by LAN Network Manager:

```
Last Ring Status: none
```

The following lines of output show Token Ring statistics. See the Token Ring specification for more information.

```
Stats: soft:0/0, hard:0/0, sig loss:0/0
      tx beacon: 0/0, wire fault 0/0, recovery: 0/0
      only station: 0/0, remote removal: 0/0
```

The following line of output indicates that Token Ring communication has been enabled on the interface. If this line of output appears, the message “Source Route Bridge capable” should appear in the **show interfaces tokenring** display.

```
Bridge: local 3330, bnum 1, target 3583
```

Table 6-10 describes the fields shown in the following line of sample output.

```
max_hops 7, target idb: 0x0, not local
```

**Table 6-10 Show Controllers Token Field Descriptions—Part 2**

Field	Description
max_hops 7	Maximum number of bridges.
target idb: 0x0	Destination interface definition.
not local	Indicates whether the interface has been defined as a local or remote bridge.

The following line of output is specific to the hardware:

```
Interface failures: 0 -- Bkgnd Ints: 0
```

In the following line of output, TX shorts are the number of packets the interface transmits that are discarded because they are smaller than the medium’s minimum packet size. TX giants are the number of packets the interface transmits that are discarded because they exceed the medium’s maximum packet size.

```
TX shorts 0, TX giants 0
```

The following line of output indicates the state of the controller. Possible values include active, failure, inactive, and reset:

```
Monitor state: (active)
```

The following line of output displays detailed information relating to the monitor state shown in the previous line of output. This information relates to the firmware on the controller. This information is relevant to Cisco engineers only if the monitor state is something other than active.

```
flags 0xC0, state 0x0, test 0x0, code 0x0, reason 0x0
```

Table 6-11 describes the fields in the following line of output:

```
f/w ver: 1.0 expr 0, chip f/w: '000000.ME31100', [bridge capable]
```

**Table 6-11 Show Controllers Token Field Descriptions—Part 3**

Field	Description
f/w ver: 1.0	Version of the Cisco firmware on the board.
chip f/w: '000000.ME31100'	Firmware on the chip set.
[bridge capable]	Interface has not been configured for bridging, but that it has that capability.

The following line of output displays the version numbers for the kernel and the accelerator microcode of the Madge firmware on the board; this firmware is the LLC interface to the chip set:

```
SMT versions: 1.01 kernel, 4.02 fastmac
```

The following line of output displays LAN Network Manager information that relates to ring status:

```
ring mode: F00, internal enables: SRB REM RPS CRS/NetMgr
```

The following line of output corresponds to the functional address and the group address shown in **show interfaces tokenring** output:

```
internal functional: 0000011A (0000011A), group: 00000000 (00000000)
```

The following line of output displays interface board state information that is proprietary to Cisco Systems:

```
if_state: 1, ints: 0/0, ghosts: 0/0, bad_states: 0/0
```

The following output lines display information that is proprietary to Cisco Systems. Cisco engineers use this information for debugging purposes.

```
t2m fifo purges: 0/0  
t2m fifo current: 0, t2m fifo max: 0/0, proto_errs: 0/0
```

Each of the fields in the following line of output maps to a field in the **show source bridge** display, as follows: ring maps to srn; bridge num maps to bn; target maps to trn; and max hops maps to max:

```
ring: 3330, bridge num: 1, target: 3583, max hops: 7
```

In the following lines of output, the number preceding the slash (/) indicates the count since the value was last displayed; the number following the slash (/) indicates count since the system was last booted:

```
Packet counts:  
receive total: 298/6197, small: 298/6197, large 0/0
```

In the following line of output, the number preceding the slash (/) indicates the count since the value was last displayed; the number following the slash (/) indicates count since the system was last booted. The runts and giants values that appear here correspond to the runts and giants values that appear in **show interfaces tokenring** output.

```
runts: 0/0, giants: 0/0
```

The following lines of output are receiver-specific information that Cisco engineers can use for debugging purposes:

```
local: 298/6197, bridged: 0/0, promis: 0/0  
bad rif: 0/0, multiframe: 0/0  
ring num mismatch 0/0, spanning violations 0  
transmit total: 1/25, small: 1/25, large 0/0  
runts: 0/0, giants: 0/0, errors 0/0
```

The following output lines include very specific statistics that are not relevant in most cases, but exist for historical purposes. In particular, the internal errors, burst errors, ari/fci, abort errors, copy errors, frequency errors, dma bus errors, and dma parity errors fields are not relevant.

```
Internal controller counts:  
line errors: 0/0, internal errors: 0/0  
burst errors: 0/0, ari/fci errors: 0/0  
abort errors: 0/0, lost frame: 0/0  
copy errors: 0/0, rcvr congestion: 0/0  
token errors: 0/0, frequency errors: 0/0  
dma bus errors: -/-, dma parity errors: -/-
```

The following lines of output are low-level Token Ring interface statistics relating to the state and status of the Token Ring with respect to all other Token Rings on the line:

```
Internal controller smt state:
Adapter MAC:      0000.3080.6f40, Physical drop:      00000000
NAUN Address:     0000.a6e0.11a6, NAUN drop:           00000000
Last source:      0000.a6e0.11a6, Last poll:           0000.3080.6f40
Last MVID:        0006, Last attn code:               0006
Txmit priority:   0006, Auth Class:                   7FFF
Monitor Error:    0000, Interface Errors:            FFFF
Correlator:       0000, Soft Error Timer:             00C8
Local Ring:       0000, Ring Status:                  0000
Beacon rcv type: 0000, Beacon txmit type:            0000
```

# show interfaces

Use the **show interfaces** EXEC command to display statistics for all interfaces configured on the communication server. The resulting output varies, depending on the network for which an interface has been configured.

```
show interfaces [type number] [accounting]
```

## Syntax Description

<i>type unit</i>	(Optional) Interface type. Allowed values include <b>async</b> , <b>ethernet</b> , <b>loopback</b> , <b>null</b> , <b>serial</b> , <b>tokenring</b> , and <b>tunnel</b> .
<i>number</i>	(Optional) Interface number
<b>accounting</b>	(Optional) Displays the number of packets of each protocol type that has been sent through the interface. You can show these numbers for all interfaces, or you can specify a specific <i>type</i> and <i>number</i> .

## Command Mode

EXEC

## Usage Guidelines

The **show interfaces** command displays statistics for the network interfaces. If you enter a **show interfaces** command for an interface type that has been removed from the communication server, interface statistics will be displayed accompanied by the following text: “Hardware has been removed.”

You will use the **show interfaces** command frequently while configuring and monitoring communication servers. The various forms of the **show interfaces** commands are described in detail in the sections immediately following this command.

To display the number of packets of each protocol type that have been sent through all configured interfaces, use the **show interfaces accounting** EXEC command. When you use the **accounting** option, only the accounting statistics are displayed.

Table 6-12 lists the protocols for which per-packet accounting information is kept.

Table 6-12 Per-Packet Counted Protocols

Protocol	Notes
ARP	For IP, Frame Relay, SMDS.
DEC MOP	The communication servers use MOP packets to advertise their existence to DEC machines that use the MOP protocol. A communication server periodically broadcasts MOP packets to identify itself as a MOP host. This results in MOP packets being counted.
HP Probe	—
IP	—
Lan Manager	LAN Network Manager and IBM Network Manager.
IPX	—

### Sample Display

The following is sample output from the **show interfaces** command. Because your display will depend on the type and number of interface cards in your communication server, only a portion of the display is shown.

```
cs# show interfaces

Ethernet 0 is up, line protocol is up
  Hardware is MCI Ethernet, address is 0000.0c00.750c (bia 0000.0c00.750c)
  Internet address is 131.108.28.8, subnet mask is 255.255.255.0
  MTU 1500 bytes, BW 10000 Kbit, DLY 100000 usec, rely 255/255, load 1/255
  Encapsulation ARPA, loopback not set, keepalive set (10 sec)
  ARP type: ARPA, ARP Timeout 4:00:00
  Last input 0:00:00, output 0:00:00, output hang never
  Last clearing of "show interface" counters 0:00:00
  Output queue 0/40, 0 drops; input queue 0/75, 0 drops
  Five minute input rate 0 bits/sec, 0 packets/sec
  Five minute output rate 2000 bits/sec, 4 packets/sec
    1127576 packets input, 447251251 bytes, 0 no buffer
    Received 354125 broadcasts, 0 runts, 0 giants
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    5332142 packets output, 496316039 bytes, 0 underruns
    0 output errors, 432 collisions, 0 interface resets, 0 restarts
---More---
```

### Sample Display with Accounting Option

The following is sample output from the **show interfaces accounting** command:

```
cs# show interfaces accounting

Ethernet0
```

Protocol	Pkts In	Chars In	Pkts Out	Chars Out
IP	873171	735923409	34624	9644258
Novell	163849	12361626	57143	4272468
DEC MOP	0	0	1	77
ARP	69618	4177080	1529	91740

When the output indicates an interface is “disabled,” the communication server has received excessive errors (over 5000 in a keepalive period).

## show interfaces async

Use the **show interfaces async** EXEC command to display information about the serial interface.

**show interfaces async** [*unit*] [**accounting**]

### Syntax Description

*unit* (Optional) Must be 1.

**accounting** (Optional) Displays the number of packets of each protocol type that have been sent through the interface.

### Command Mode

EXEC

### Sample Display

The following is sample output from the **show interfaces async** command:

```
cs# show interfaces async 1

Async 1 is up, line protocol is up
  Hardware is Async Serial
  Internet address is 1.0.0.1, subnet mask is 255.0.0.0
  MTU 1500 bytes, BW 9 Kbit, DLY 100000 usec, rely 255/255, load 56/255
  Encapsulation SLIP, keepalive set (0 sec)
  Last input 0:00:03, output 0:00:03, output hang never
  Last clearing of "show interface" counters never
  Output queue 0/3, 2 drops; input queue 0/0, 0 drops
  Five minute input rate 0 bits/sec, 1 packets/sec
  Five minute output rate 2000 bits/sec, 1 packets/sec
  273 packets input, 13925 bytes, 0 no buffer
  Received 0 broadcasts, 0 runts, 0 giants
  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
  221 packets output, 41376 bytes, 0 underruns
  0 output errors, 0 collisions, 0 interface resets, 0 restarts
  0 carrier transitions
```

---

**Note** The communication server does not detect the start of a SLIP packet on an asynchronous interface. When the SLIP connection is established, the communication server only knows that it is working with the SLIP host that is generating traffic after it receives an END byte. Data that is transmitted before the END byte is counted as an error.

---

The following is a sample display from the **show interfaces async accounting** command:

```
cs# show interfaces async 0 accounting

Async 0
  Protocol  Pkts In   Chars In  Pkts Out   Chars Out
  IP        7344       4787842   1803       1535774
  DEC MOP   0          0         127        9779
  ARP       7         420       39         2340
```

The **show line** and **show slip** commands can also be useful in monitoring asynchronous interfaces.

Table 6-13 describes the fields shown in the two sample displays.

**Table 6-13 Show Interfaces Async Field Descriptions**

Field	Description
Async... is {up   down   administratively down}	Indicates whether the interface hardware is currently active (whether carrier detect is present) and if it has been taken down by an administrator.
line protocol is {up   down   administratively down}	Indicates whether the software processes that handle the line protocol think the line is usable (that is, whether keepalives are successful).
Hardware is	Hardware type.
Internet address is	IP address.
Subnet mask is	Subnet mask.
MTU	Maximum transmission unit of the interface.
BW	Bandwidth of the interface in kilobits per second.
DLY	Delay of the interface in microseconds.
rely	Reliability of the interface as a fraction of 255 (255/255 is 100% reliability), calculated as an exponential average over five minutes.
load	Load on the interface as a fraction of 255 (255/255 is completely saturated), calculated as an exponential average over five minutes. The calculation uses the value from the <b>bandwidth</b> interface configuration command.
Encapsulation	Encapsulation method assigned to interface.
keepalive	Indicates whether keepalives are set or not.
Last input	Number of hours, minutes, and seconds since the last packet was successfully received by an interface. Useful for knowing when a dead interface failed.
output	The number of hours, minutes, and seconds since the last packet was successfully transmitted by an interface.
output hang	Number of hours, minutes, and seconds (or never) since the interface was last reset because of a transmission that took too long. When the number of hours in any of the “last” fields exceeds 24 hours, the number of days and hours is printed. If that field overflows, asterisks are printed.

Field	Description
Last clearing	The time at which the counters that measure cumulative statistics (such as number of bytes transmitted and received) shown in this report were last reset to zero. Note that variables that might affect routing (for example, load and reliability) are not cleared when the counters are cleared. *** indicates the elapsed time is too large to be displayed. 0:00:00 indicates the counters were cleared more than $2^{31}$ ms (and less than $2^{32}$ ms) ago.
Output queue, drops input queue, drops	Number of packets in output and input queues. Each number is followed by a slash, the maximum size of the queue, and the number of packets dropped due to a full queue.
Five minute input rate, Five minute output rate	Average number of bits and packets transmitted per second in the last five minutes.
packets input	Total number of error-free packets received by the system.
bytes	Total number of bytes, including data and MAC encapsulation, in the error free packets received by the system.
no buffer	Number of received packets discarded because there was no buffer space in the main system. Compare with ignored count. Broadcast storms on Ethernets and bursts of noise on serial lines are often responsible for no input buffer events.
broadcasts	Total number of broadcast or multicast packets received by the interface.
runts	Number of packets that are discarded because they are smaller than the medium's minimum packet size.
giants	Number of packets that are discarded because they exceed the medium's maximum packet size.
input errors	Total number of no buffer, runts, giants, CRCs, frame, overrun, ignored, and abort counts. Other input-related errors can also increment the count, so that this sum might not balance with the other counts.
CRC	The cyclic redundancy checksum generated by the originating LAN station or far end device does not match the checksum calculated from the data received. On a LAN, this usually indicates noise or transmission problems on the LAN interface or the LAN bus itself. A high number of CRC's is usually the result of collisions or a station transmitting bad data. On a serial link, CRC's usually indicate noise, gain hits or other transmission problems on the data link.
frame	Number of packets received incorrectly having a CRC error and a noninteger number of octets. On a serial line, this is usually the result of noise or other transmission problems.
overrun	Number of times the serial receiver hardware was unable to hand received data to a hardware buffer because the input rate exceeded the receiver's ability to handle the data.
ignored	Number of received packets ignored by the interface because the interface hardware ran low on internal buffers. These buffers are different than the system buffers mentioned previously in the buffer description. Broadcast storms and bursts of noise can cause the ignored count to be incremented.

Field	Description
abort	Illegal sequence of one bits on a serial interface. This usually indicates a clocking problem between the serial interface and the data link equipment.
packets output	Total number of messages transmitted by the system.
bytes	Total number of bytes, including data and MAC encapsulation, transmitted by the system.
underruns	Number of times that the far-end transmitter has been running faster than the near-end communication server's receiver can handle. This might never be reported on some interfaces.
output errors	Sum of all errors that prevented the final transmission of datagrams out of the interface being examined. Note that this might not balance with the sum of the enumerated output errors, as some datagrams might have more than one error, and others might have errors that do not fall into any of the specifically tabulated categories.
interface resets	Number of times an interface has been completely reset. This can happen if packets queued for transmission were not sent within several seconds. On a serial line, this can be caused by a malfunctioning modem that is not supplying the transmit clock signal, or by a cable problem. If the system notices that the carrier detect line of a serial interface is up, but the line protocol is down, it periodically resets the interface in an effort to restart it. Interface resets can also occur when an interface is looped back or shut down.
restarts	Number of times the controller was restarted because of errors.
carrier transitions	Number of times the carrier detect signal of a serial interface has changed state. Indicates modem or line problems if the carrier detect line is changing state often.
Protocol	Protocol that is operating on the interface.
Pkts In	Number of packets received for that protocol.
Chars In	Number of characters received for that protocol.
Pkts Out	Number of packets transmitted for that protocol.
Chars Out	Number of characters transmitted for that protocol.

# show interfaces dialer

Use the **show interfaces dialer** EXEC command to display information about the dialer interface.

```
show interfaces dialer unit [accounting]
```

## Syntax Description

<i>unit</i>	Must match a port number on the selected interface.
<b>accounting</b>	(Optional) Displays the number of packets of each protocol type that have been sent through the interface.

## Command Mode

EXEC

## show interfaces ethernet

Use the **show interfaces ethernet** EXEC command to display information about an Ethernet interface on the communication server.

**show interfaces ethernet** *unit* [**accounting**]

### Syntax Description

<i>unit</i>	Must match a port number on the selected interface.
<b>accounting</b>	(Optional) Displays the number of packets of each protocol type that have been sent through the interface.

### Command Mode

EXEC

### Usage Guidelines

If you do not provide values for the argument *unit*, the command will display statistics for all network interfaces. The optional keyword **accounting** displays the number of packets of each protocol type that have been sent through the interface.

### Sample Display

The following is sample output from the **show interfaces** command for the Ethernet 0 interface:

```
cs# show interfaces ethernet 0

Ethernet 0 is up, line protocol is up
  Hardware is MCI Ethernet, address is aa00.0400.0134 (bia 0000.0c00.4369)
  Internet address is 131.108.1.1, subnet mask is 255.255.255.0
  MTU 1500 bytes, BW 10000 Kbit, DLY 1000 usec, rely 255/255, load 1/255
  Encapsulation ARPA, loopback not set, keepalive set (10 sec)
  ARP type: ARPA, PROBE, ARP Timeout 4:00:00
  Last input 0:00:00, output 0:00:00, output hang never
  Output queue 0/40, 0 drops; input queue 0/75, 2 drops
  Five minute input rate 61000 bits/sec, 4 packets/sec
  Five minute output rate 1000 bits/sec, 2 packets/sec
    2295197 packets input, 305539992 bytes, 0 no buffer
    Received 1925500 broadcasts, 0 runts, 0 giants
    3 input errors, 3 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    3594664 packets output, 436549843 bytes, 0 underruns
    8 output errors, 1790 collisions, 10 interface resets, 0 restarts
```

Table 6-14 describes significant fields shown in the display.

**Table 6-14 Show Interfaces Ethernet Field Descriptions**

Field	Description
Ethernet ... is up ...is administratively down	Indicates whether the interface hardware is currently active and if it has been taken down by an administrator. “Disabled” indicates the communication server has received over 5000 errors in a keepalive interval, which is 10 seconds by default.
line protocol is {up   down   administratively down}	Indicates whether the software processes that handle the line protocol believe the interface is usable (that is, whether keepalives are successful) or if it has been taken down by an administrator.
Hardware	Hardware type (for example, MCI Ethernet, SCI, Ethernet) and address.
Internet address	IP address followed by subnet mask.
MTU	Maximum transmission unit of the interface.
BW	Bandwidth of the interface in kilobits per second.
DLY	Delay of the interface in microseconds.
rely	Reliability of the interface as a fraction of 255 (255/255 is 100% reliability), calculated as an exponential average over five minutes.
load	Load on the interface as a fraction of 255 (255/255 is completely saturated), calculated as an exponential average over five minutes.
Encapsulation	Encapsulation method assigned to interface.
loopback	Indicates whether loopback is set or not.
keepalive	Indicates whether keepalives are set or not.
ARP type:	Type of Address Resolution Protocol assigned.
Last input	Number of hours, minutes, and seconds since the last packet was successfully received by an interface. Useful for knowing when a dead interface failed.
output	Number of hours, minutes, and seconds since the last packet was successfully transmitted by the interface. Useful for knowing when a dead interface failed.
output hang	Number of hours, minutes, and seconds (or never) since the interface was last reset because of a transmission that took too long. When the number of hours in any of the “last” fields exceeds 24 hours, the number of days and hours is printed. If that field overflows, asterisks are printed.
Output queue, input queue, drops	Number of packets in output and input queues. Each number is followed by a slash, the maximum size of the queue, and the number of packets dropped due to a full queue.
Five minute input rate, Five minute output rate	<p>Average number of bits and packets transmitted per second in the last five minutes. If the interface is not in promiscuous mode, it senses network traffic it sends and receives (rather than all network traffic).</p> <p>The five-minute input and output rates should be used only as an approximation of traffic per second during a given five-minute period. These rates are exponentially weighted averages with a time constant of five minutes. A period of four time constants must pass before the average will be within two percent of the instantaneous rate of a uniform stream of traffic over that period.</p>
packets input	Total number of error-free packets received by the system.

Field	Description
bytes	Total number of bytes, including data and MAC encapsulation, in the error free packets received by the system.
no buffer	Number of received packets discarded because there was no buffer space in the main system. Compare with ignored count. Broadcast storms on Ethernets and bursts of noise on serial lines are often responsible for no input buffer events.
Received ... broadcasts	Total number of broadcast or multicast packets received by the interface.
runt	Number of packets that are discarded because they are smaller than the medium's minimum packet size. For instance, any Ethernet packet that is less than 64 bytes is considered a runt.
giants	Number of packets that are discarded because they exceed the medium's maximum packet size. For example, any Ethernet packet that is greater than 1,518 bytes is considered a giant.
input errors	Includes runts, giants, no buffer, CRC, frame, overrun, and ignored counts. Other input-related errors can also cause the input errors count to be increased, and some datagrams might have more than one error; therefore, this sum might not balance with the sum of enumerated input error counts.
CRC	Cyclic redundancy check generated by the originating LAN station or far-end device does not match the checksum calculated from the data received. On a LAN, this usually indicates noise or transmission problems on the LAN interface or the LAN bus itself. A high number of CRCs is usually the result of collisions or a station transmitting bad data.
frame	Number of packets received incorrectly having a CRC error and a noninteger number of octets. On a LAN, this is usually the result of collisions or a malfunctioning Ethernet device.
overrun	Number of times the receiver hardware was unable to hand received data to a hardware buffer because the input rate exceeded the receiver's ability to handle the data.
ignored	Number of received packets ignored by the interface because the interface hardware ran low on internal buffers. These buffers are different than the system buffers mentioned previously in the buffer description. Broadcast storms and bursts of noise can cause the ignored count to be increased.
abort	Number of packets whose receipt was aborted.
packets output	Total number of messages transmitted by the system.
bytes	Total number of bytes, including data and MAC encapsulation, transmitted by the system.
underruns	Number of times that the transmitter has been running faster than the communication server can handle. This might never be reported on some interfaces.
output errors	Sum of all errors that prevented the final transmission of datagrams out of the interface being examined. Note that this might not balance with the sum of the enumerated output errors, as some datagrams might have more than one error, and others might have errors that do not fall into any of the specifically tabulated categories.

Field	Description
collisions	Number of messages retransmitted due to an Ethernet collision. This is usually the result of an overextended LAN (Ethernet or transceiver cable too long, more than two repeaters between stations, or too many cascaded multiport transceivers). A packet that collides is counted only once in output packets.
interface resets	Number of times an interface has been completely reset. This can happen if packets queued for transmission were not sent within several seconds' time. On a serial line, this can be caused by a malfunctioning modem that is not supplying the transmit clock signal, or by a cable problem. If the system notices that the carrier detect line of a serial interface is up, but the line protocol is down, it periodically resets the interface in an effort to restart it. Interface resets can also occur when an interface is looped back or shut down.
restarts	Number of times a Type 2 Ethernet controller was restarted because of errors.

## show interfaces loopback

Use the **show interfaces loopback EXEC** command to display information about the dialer interface.

**show interfaces loopback** [*unit*] [**accounting**]

### Syntax Description

<i>unit</i>	(Optional) Must match a port number on the selected interface.
<b>accounting</b>	(Optional) Displays the number of packets of each protocol type that have been sent through the interface.

### Command Mode

EXEC

### Sample Displays

The following is sample output from the **show interfaces loopback** command:

```
cs# show interfaces loopback 0

Loopback0 is up, line protocol is up
  Hardware is Loopback
  MTU 1500 bytes, BW 1 Kbit, DLY 50 usec, rely 255/255, load 1/255
  Encapsulation UNKNOWN, loopback not set, keepalive set (10 sec)
  Last input never, output never, output hang never
  Last clearing of "show interface" counters never
  Output queue 0/0, 0 drops; input queue 0/75, 0 drops
  Five minute input rate 0 bits/sec, 0 packets/sec
  Five minute output rate 0 bits/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 no buffer
    Received 0 broadcasts, 0 runts, 0 giants
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    0 input packets with dribble condition detected
    0 packets output, 0 bytes, 0 underruns
    0 output errors, 0 collisions, 0 interface resets, 0 restarts
```

The following is sample when the **accounting** keyword is included:

```
cs# show interfaces loopback 0 accounting

Loopback0
      Protocol    Pkts In   Chars In   Pkts Out   Chars Out
No traffic sent or received on this interface.
```

Table 6-15 describes significant fields shown in the displays.

**Table 6-15 Show Interfaces Loopback Descriptions**

Field	Description
Loopback is {up   down   administratively down}	Indicates whether the interface hardware is currently active (whether carrier detect is present) and if it has been taken down by an administrator. “Disabled” indicates the communication server has received over 5000 errors in a keepalive interval, which is 10 seconds by default.
line protocol is {up   down   administratively down}	Indicates whether the software processes that handle the line protocol considers the line usable (that is, whether keepalives are successful).
Hardware	Hardware is Loopback.
MTU	Maximum transmission unit of the interface.
BW	Bandwidth of the interface in kilobits per second.
DLY	Delay of the interface in microseconds.
rely	Reliability of the interface as a fraction of 255 (255/255 is 100% reliability), calculated as an exponential average over five minutes.
load	Load on the interface as a fraction of 255 (255/255 is completely saturated), calculated as an exponential average over five minutes.
Encapsulation	Encapsulation method assigned to interface.
loopback	Indicates whether loopback is set and type of loopback test.
keepalive	Indicates whether keepalives are set or not.
Last input	Number of hours, minutes, and seconds since the last packet was successfully received by an interface. Useful for knowing when a dead interface failed.
output	Number of hours, minutes, and seconds since the last packet was successfully transmitted by an interface.
output hang	Number of hours, minutes, and seconds (or never) since the interface was last reset because of a transmission that took too long. When the number of hours in any of the “last” fields exceeds 24 hours, the number of days and hours is printed. If that field overflows, asterisks are printed.
Last clearing	Time at which the counters that measure cumulative statistics (such as number of bytes transmitted and received) shown in this report were last reset to zero. Note that variables that might affect routing (for example, load and reliability) are not cleared when the counters are cleared. *** indicates the elapsed time is too large to be displayed. 0:00:00 indicates the counters were cleared more than $2^{31}$ ms (and less than $2^{32}$ ms) ago.
Output queue, drops Input queue, drops	Number of packets in output and input queues. Each number is followed by a slash, the maximum size of the queue, and the number of packets dropped due to a full queue.
Five minute input rate, Five minute output rate	Average number of bits and packets transmitted per second in the last five minutes.
packets input	Total number of error-free packets received by the system.

Field	Description
bytes	Total number of bytes, including data and MAC encapsulation, in the error free packets received by the system.
no buffer	Number of received packets discarded because there was no buffer space in the main system. Compare with ignored count. Broadcast storms on Ethernets and bursts of noise on serial lines are often responsible for no input buffer events.
broadcasts	Total number of broadcast or multicast packets received by the interface.
runt	Number of packets that are discarded because they are smaller than the medium's minimum packet size.
giants	Number of packets that are discarded because they exceed the medium's maximum packet size.
input errors	Sum of all errors that prevented the receipt of datagrams on the interface being examined. This might not balance with the sum of the enumerated output errors, because some datagrams might have more than one error and others might have errors that do not fall into any of the specifically tabulated categories.
CRC	Cyclic redundancy check generated by the originating LAN station or far-end device does not match the checksum calculated from the data received. On a LAN, this usually indicates noise or transmission problems on the LAN interface or the LAN bus itself. A high number of CRCs is usually the result of collisions or a station transmitting bad data. On a serial link, CRCs usually indicate noise, gain hits, or other transmission problems on the data link. CRC errors are also reported when a far-end abort occurs, and when the idle flag pattern is corrupted. This makes it possible to get CRC errors even when there is no data traffic.
frame	Number of packets received incorrectly having a CRC error and a noninteger number of octets. On a serial line, this is usually the result of noise or other transmission problems.
overrun	Number of times the serial receiver hardware was unable to hand received data to a hardware buffer because the input rate exceeded the receiver's ability to handle the data.
ignored	Number of received packets ignored by the interface because the interface hardware ran low on internal buffers. These buffers are different than the system buffers mentioned previously in the buffer description. Broadcast storms and bursts of noise can cause the ignored count to be increased.
abort	Number of packets whose receipt was aborted.
packets output	Total number of messages transmitted by the system.
bytes output	Total number of bytes, including data and MAC encapsulation, transmitted by the system.
underruns	Number of times that the far-end transmitter has been running faster than the near-end communication server's receiver can handle. This might never happen (be reported) on some interfaces.

Field	Description
output errors	Sum of all errors that prevented the final transmission of datagrams out of the interface being examined. Note that this might not balance with the sum of the enumerated output errors, as some datagrams might have more than one error, and others might have errors that do not fall into any of the specifically tabulated categories.
interface resets	Number of times an interface has been completely reset. This can happen if packets queued for transmission were not sent within several seconds time. On a serial line, this can be caused by a malfunctioning modem that is not supplying the transmit clock signal, or by a cable problem. If the system notices that the carrier detect line of a serial interface is up, but the line protocol is down, it periodically resets the interface in an effort to restart it. Interface resets can also occur when an interface is looped back or shut down.
restarts	Number of times the controller was restarted because of errors.
Protocol	Protocol that is operating on the interface.
Pkts In	Number of packets received for that protocol.
Chars In	Number of characters received for that protocol.
Pkts Out	Number of packets transmitted for that protocol.
Chars Out	Number of characters transmitted for that protocol.

# show interfaces serial

Use the **show interfaces serial** privileged EXEC command to display information about a serial interface.

**show interfaces serial** *number* [**accounting**]

## Syntax Description

- number*

(Optional) Must match the interface port number.
- accounting**

(Optional) Displays the number of packets of each protocol type that have been sent through the interface.

## Command Mode

Privileged EXEC

## Sample Display

The following is sample output from the **show interfaces** command for a synchronous serial interface:

```
cs# show interfaces serial

Serial 0 is up, line protocol is up
  Hardware is MCI Serial
  Internet address is 150.136.190.203, subnet mask is 255.255.255.0
  MTU 1500 bytes, BW 1544 Kbit, DLY 20000 usec, rely 255/255, load 1/255
  Last input 0:00:07, output 0:00:00, output hang never
  Output queue 0/40, 0 drops; input queue 0/75, 0 drops
  Five minute input rate 0 bits/sec, 0 packets/sec
  Five minute output rate 0 bits/sec, 0 packets/sec
    16263 packets input, 1347238 bytes, 0 no buffer
    Received 13983 broadcasts, 0 runts, 0 giants
      2 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 2 abort
  1 carrier transitions

    22146 packets output, 2383680 bytes, 0 underruns
    0 output errors, 0 collisions, 2 interface resets, 0 restarts
```

Table 6-16 describes significant fields shown in the display.

Table 6-16 Show Interfaces Serial Field Descriptions

Field	Description
Serial ... is {up   down   administratively down}	Indicates whether the interface hardware is currently active (whether carrier detect is present) and if it has been taken down by an administrator. “Disabled” indicates the communication server has received over 5000 errors in a keepalive interval, which is 10 seconds by default.
line protocol is {up   down}	Indicates whether the software processes that handle the line protocol consider the line usable (that is, whether keepalives are successful) or if it has been taken down by an administrator.
Hardware is	Specifies the hardware type.
Internet address is	Specifies the IP address.

Field	Description
subnet mask	Subnet mask.
MTU	Maximum transmission unit of the interface.
BW	Indicates the value of the bandwidth parameter that has been configured for the interface (in kilobits per second). The bandwidth parameter is used to compute IGRP metrics only. If the interface is attached to a serial line with a line speed that does not match the default (1536 or 1544 for T1 and 56 for a standard synchronous serial line), use the <b>bandwidth</b> command to specify the correct line speed for this serial line.
DLY	Delay of the interface in microseconds.
rely	Reliability of the interface as a fraction of 255 (255/255 is 100% reliability), calculated as an exponential average over five minutes.
load	Load on the interface as a fraction of 255 (255/255 is completely saturated), calculated as an exponential average over five minutes.
Last input	Number of hours, minutes, and seconds since the last packet was successfully received by an interface. Useful for knowing when a dead interface failed.
output	Number of hours, minutes, and seconds since the last packet was successfully transmitted by an interface.
output hang	Number of hours, minutes, and seconds (or never) since the interface was last reset because of a transmission that took too long. When the number of hours in any of the “last” fields exceeds 24 hours, the number of days and hours is printed. If that field overflows, asterisks are printed.
Output queue, drops input queue, drops	Number of packets in output and input queues. Each number is followed by a slash, the maximum size of the queue, and the number of packets dropped due to a full queue.
Five minute input rate Five minute output rate	Average number of bits and packets transmitted per second in the last five minutes.  The five-minute input and output rates should be used only as an approximation of traffic per second during a given five-minute period. These rates are exponentially weighted averages with a time constant of five minutes. A period of four time constants must pass before the average will be within two percent of the instantaneous rate of a uniform stream of traffic over that period.
packets input	Total number of error-free packets received by the system.
bytes	Total number of bytes, including data and MAC encapsulation, in the error free packets received by the system.
no buffer	Number of received packets discarded because there was no buffer space in the main system. Compare with ignored count. Broadcast storms on Ethernets and bursts of noise on serial lines are often responsible for no input buffer events.
Received ... broadcasts	Total number of broadcast or multicast packets received by the interface.
runts	Number of packets that are discarded because they are smaller than the medium's minimum packet size.
giants	Number of packets that are discarded because they exceed the medium's maximum packet size.

Field	Description
input errors	Total number of no buffer, runts, giants, CRCs, frame, overrun, ignored, and abort counts. Other input-related errors can also increment the count, so that this sum might not balance with the other counts.
CRC	Cyclic redundancy check generated by the originating station or far-end device does not match the checksum calculated from the data received. On a serial link, CRCs usually indicate noise, gain hits, or other transmission problems on the data link.
frame	Number of packets received incorrectly having a CRC error and a noninteger number of octets. On a serial line, this is usually the result of noise or other transmission problems.
overrun	Number of times the serial receiver hardware was unable to hand received data to a hardware buffer because the input rate exceeded the receiver's ability to handle the data.
ignored	Number of received packets ignored by the interface because the interface hardware ran low on internal buffers. Broadcast storms and bursts of noise can cause the ignored count to be increased.
abort	Illegal sequence of one bits on a serial interface. This usually indicates a clocking problem between the serial interface and the data link equipment.
carrier transitions	Number of times the carrier detect signal of a serial interface has changed state. Indicates modem or line problems if the carrier detect line is changing state often.
packets output	Total number of messages transmitted by the system.
bytes	Total number of bytes, including data and MAC encapsulation, transmitted by the system.
underruns	Number of times that the transmitter has been running faster than the communication server can handle. This may never be reported on some interfaces.
output errors	Sum of all errors that prevented the final transmission of datagrams out of the interface being examined. Note that this might not balance with the sum of the enumerated output errors, as some datagrams might have more than one error, and others might have errors that do not fall into any of the specifically tabulated categories.
collisions	Number of messages retransmitted due to an Ethernet collision. This usually is the result of an overextended LAN (Ethernet or transceiver cable too long, more than two repeaters between stations, or too many cascaded multiport transceivers). Some collisions are normal. However, if your collision rate climbs to around 4-5%, you should consider verifying that there is no faulty equipment on the segment and/or moving some existing stations to a new segment. A packet that collides is counted only once in output packets.
interface resets	Number of times an interface has been completely reset. This can happen if packets queued for transmission were not sent within several seconds' time. On a serial line, this can be caused by a malfunctioning modem that is not supplying the transmit clock signal, or by a cable problem. If the system notices that the carrier detect line of a serial interface is up, but the line protocol is down, it periodically resets the interface in an effort to restart it. Interface resets can also occur when an interface is looped back or shut down.
restarts	Number of times the controller was restarted because of errors.

### Sample Display with Frame Relay Encapsulation

When using the Frame Relay encapsulation, use the **show interfaces** command to display information on the multicast DLCI, the DLCI of the interface, and the LMI DLCI used for the local management interface.

The multicast DLCI and the local DLCI can be set using the **frame-relay multicast-dlci** and the **frame-relay local-dlci** configuration commands, or provided through the local management interface. The status information is taken from the LMI, when active.

The following is a sample display from the **show interfaces serial** output when using Frame Relay encapsulation:

```
cs# show interfaces serial

Serial 2 is up, line protocol is up
  Hardware type is MCI Serial
  Internet address is 131.108.122.1, subnet mask is 255.255.255.0
  MTU 1500 bytes, BW 1544 Kbit, DLY 20000 usec, rely 255/255, load 1/255
  Encapsulation FRAME-RELAY, loopback not set, keepalive set (10 sec)
  multicast DLCI 1022, status defined, active
  source DLCI 20, status defined, active
  LMI DLCI 1023, LMI sent 10, LMI stat recvd 10, LMI upd recvd 2
  Last input 7:21:29, output 0:00:37, output hang never
  Output queue 0/100, 0 drops; input queue 0/75, 0 drops
  Five minute input rate 0 bits/sec, 0 packets/sec
  Five minute output rate 0 bits/sec, 0 packets/sec
    47 packets input, 2656 bytes, 0 no buffer
    Received 5 broadcasts, 0 runts, 0 giants
    5 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 57 abort
    518 packets output, 391205 bytes
    0 output errors, 0 collisions, 0 interface resets, 0 restarts
    1 carrier transitions
```

In this display, the multicast DLCI has been changed to 1022 with the **frame-relay multicast-dlci** interface configuration command.

The display shows the statistics for the LMI are the number of status inquiry messages sent (LMI sent), the number of status messages received (LMI recvd), and the number of status updates received (upd recvd). See the *Frame Relay Interface* specification for additional explanations of this output.

### Sample Display with ANSI LMI

For a serial interface with the ANSI LMI enabled, use the **show interfaces** command to determine the LMI type implemented.

The following is a sample display from the **show interfaces** output for a serial interface with the ANSI LMI enabled.

```
cs# show interfaces serial

Serial 1 is up, line protocol is up
Hardware is MCI Serial
Internet address is 131.108.121.1, subnet mask is 255.255.255.0
MTU 1500 bytes, BW 1544 Kbit, DLY 20000 usec, rely 255/255, load 1/255
Encapsulation FRAME-RELAY, loopback not set, keepalive set
LMI DLCI 0, LMI sent 10, LMI stat recvd 10
LMI type is ANSI Annex D
Last input 0:00:00, output 0:00:00, output hang never
Output queue 0/40, 0 drops; input queue 0/75, 0 drops
Five minute input rate 0 bits/sec, 1 packets/sec
Five minute output rate 1000 bits/sec, 1 packets/sec
  261 packets input, 13212 bytes, 0 no buffer
    Received 33 broadcasts, 0 runts, 0 giants
      0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    238 packets output, 14751 bytes, 0 underruns
      0 output errors, 0 collisions, 0 interface resets, 0 restarts
```

Notice that the **show interfaces** output for a serial interface with ANSI LMI is very similar to that for encapsulation set to Frame Relay, as shown in the previous display. Table 6-17 describes the differences that exist.

**Table 6-17 Show Interfaces Field Description with ANSI LMI**

Field	Description
LMI DLCI 0	Identifies the DLCI used by the LMI for this interface. Default: 1023.
LMI sent 10	Number of LMI packets the communication server sent.
LMI type is ANSI Annex D	Indicates that the interface is configured for the ANS-adopted Frame Relay specification T1.617 Annex D.

### Sample Display with LAPB Encapsulation

Use the **show interfaces** command to display operation statistics for an interface using LAPB encapsulation.

The following is sample output from the **show interfaces** command for a serial interface using LAPB encapsulation:

```
cs# show interfaces

LAPB state is DISCONNECT, T1 3000, N1 12000, N2 20, K7, TH 3000
Window is closed
IFRAMES 12/28 RNRs 0/1 REJs 13/1 SABMs 1/13 FRMRs 3/0 DISCs 0/11
```

Table 6-18 shows the fields relevant to all LAPB connections.

**Table 6-18 Show Interfaces Serial Fields and Descriptions When LAPB Is Enabled**

Parameter	Description
LAPB state is DISCONNECT	State of the LAPB protocol.
T1 3000, N1 12000, ...	Current parameter settings.
Window is closed	Indicates that no more frames can be transmitted until some outstanding frames have been acknowledged.
IFRAMEs 12/28 RNRs 0/1 ...	Count of the different types of frames in the form of sent/received.

**Show Interfaces Serial with PPP**

An interface configured for synchronous PPP encapsulation differs from the standard **show interface serial** output in the fourth and fifth lines displayed. An interface configured for PPP might include the following information:

```
Encapsulation PPP, loopback not set, keepalive set (10 sec)
PPP: No valid link quality reports received.
```

The output line that reads “PPP: No valid link quality reports received” indicates that no reports have been received. If link quality monitoring is not negotiated, then that line will indicate the following:

```
PPP: LQM not negotiated.
```

If LQM has been negotiated, and if link quality reports have been received, it will display the following:

```
PPP: LQR transmit interval 10 sec, receive interval 10 sec
      local tx/remote rx: packets 50/50 bytes 147/147 success 16/16
      remote tx/local rx: packets 49/50 bytes 753/790 success 16/16
```

This display contrasts the number of packets and bytes transmitted with the number received by the remote end, and the number of successful link quality reports received.

## show interfaces tokenring

Use the **show interfaces tokenring** EXEC command to display information about the Token Ring interface and the state of source route bridging.

**show interfaces tokenring** *unit* [**accounting**]

### Syntax Description

<i>unit</i>	Must match the interface port line number.
<b>accounting</b>	(Optional) Displays the number of packets of each protocol type that have been sent through the interface.

### Command Mode

EXEC

### Usage Guidelines

The optional keyword **accounting** displays the number of packets of each protocol type that have been sent through the interface.

### Sample Display

The following is sample output from the **show interfaces tokenring** command.

```
cs# show interfaces tokenring

TokenRing 0 is up, line protocol is up
Hardware is 16/4 Token Ring, address is 5500.2000.dc27 (bia 0000.3000.072b)
  Internet address is 150.136.230.203, subnet mask is 255.255.255.0
  MTU 8136 bytes, BW 16000 Kbit, DLY 630 usec, rely 255/255, load 1/255
  Encapsulation SNAP, loopback not set, keepalive set (10 sec)
  ARP type: SNAP, ARP Timeout 4:00:00
  Ring speed: 16 Mbps
  Single ring node, Source Route Bridge capable
  Group Address: 0x00000000, Functional Address: 0x60840000
  Last input 0:00:01, output 0:00:01, output hang never
  Output queue 0/40, 0 drops; input queue 0/75, 0 drops
  Five minute input rate 0 bits/sec, 0 packets/sec
  Five minute output rate 0 bits/sec, 0 packets/sec
  16339 packets input, 1496515 bytes, 0 no buffer
    Received 9895 broadcasts, 0 runts, 0 giants
      0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    32648 packets output, 9738303 bytes, 0 underruns
  0 output errors, 0 collisions, 2 interface resets, 0 restarts
  5 transitions
```

Table 6-19 describes significant fields shown in the display.

**Table 6-19 Show Interfaces Tokenring Field Descriptions**

Field	Description
Token Ring is up   down	Interface is either currently active and inserted into ring (up) or inactive and not inserted (down).  “Disabled” indicates the communication server has received over 5000 errors in a keepalive interval, which is 10 seconds by default.
Token Ring is Reset	Hardware error has occurred.
Token Ring is Initializing	Hardware is up, in the process of inserting the ring.
Token Ring is Administratively Down	Hardware has been taken down by an administrator.
line protocol is {up   down   administratively down}	Indicates whether the software processes that handle the line protocol believe the interface is usable (that is, whether keepalives are successful).
Hardware	Hardware type. “Hardware is Token Ring” indicates that the board is a CSC-R board. “Hardware is 16/4 Token Ring” indicates that the board is a CSC-R16 board. Also shows the address of the interface.
Internet address	Lists the IP address followed by subnet mask.
MTU	Maximum transmission unit of the interface.
BW	Bandwidth of the interface in kilobits per second.
DLY	Delay of the interface in microseconds.
rely	Reliability of the interface as a fraction of 255 (255/255 is 100% reliability), calculated as an exponential average over five minutes.
load	Load on the interface as a fraction of 255 (255/255 is completely saturated), calculated as an exponential average over five minutes.
Encapsulation	Encapsulation method assigned to interface.
loopback	Indicates whether loopback is set or not.
keepalive	Indicates whether keepalives are set or not.
ARP type	Type of Address Resolution Protocol assigned.
Ring speed	Speed of Token Ring—4 or 16 Mbps.
{Single ring/multiring node}	Indicates whether a node is enabled to collect and use source routing information (RIF) for routable Token Ring protocols.
Group Address	Interface’s group address, if any. The group address is a multicast address; any number of interfaces on the ring can share the same group address. Each interface can have at most one group address.
Last input	Number of hours, minutes, and seconds since the last packet was successfully received by an interface. Useful for knowing when a dead interface failed.
output	Number of hours, minutes, and seconds since the last packet was successfully transmitted by an interface.

Field	Description
output hang	Number of hours, minutes, and seconds (or never) since the interface was last reset because of a transmission that took too long. When the number of hours in any of the “last” fields exceeds 24 hours, the number of days and hours is printed. If that field overflows, asterisks are printed.
Output queue, drops Input queue, drops	Number of packets in output and input queues. Each number is followed by a slash, the maximum size of the queue, and the number of packets dropped due to a full queue.
Five minute input rate, Five minute output rate	<p>Average number of bits and packets transmitted per second in the last five minutes.</p> <p>The five-minute input and output rates should be used only as an approximation of traffic per second during a given five-minute period. These rates are exponentially weighted averages with a time constant of five minutes. A period of four time constants must pass before the average will be within two percent of the instantaneous rate of a uniform stream of traffic over that period.</p>
packets input	Total number of error-free packets received by the system.
bytes	Total number of bytes, including data and MAC encapsulation, in the error free packets received by the system.
no buffer	Number of received packets discarded because there was no buffer space in the main system. Compare with ignored count. Broadcast storms on Ethernets and bursts of noise on serial lines are often responsible for no input buffer events.
Received... broadcasts	Total number of broadcast or multicast packets received by the interface.
runts	Number of packets that are discarded because they are smaller than the medium’s minimum packet size.
giants	Number of packets that are discarded because they exceed the medium’s maximum packet size.
input errors	Total number of no buffer, runts, giants, CRCs, frame, overrun, ignored, and abort counts. Other input-related errors can also increment the count, so that this sum might not balance with the other counts.
CRC	Cyclic redundancy check generated by the originating LAN station or far-end device does not match the checksum calculated from the data received. On a LAN, this usually indicates noise or transmission problems on the LAN interface or the LAN bus itself. A high number of CRCs is usually the result of a station transmitting bad data.
frame	Number of packets received incorrectly having a CRC error and a noninteger number of octets.
overrun	Number of times the serial receiver hardware was unable to hand received data to a hardware buffer because the input rate exceeded the receiver’s ability to handle the data.

Field	Description
ignored	Number of received packets ignored by the interface because the interface hardware ran low on internal buffers. These buffers are different than the system buffers mentioned previously in the buffer description. Broadcast storms and bursts of noise can cause the ignored count to be increased.
packets output	Total number of messages transmitted by the system.
bytes	Total number of bytes, including data and MAC encapsulation, transmitted by the system.
underruns	Number of times that the far-end transmitter has been running faster than the near-end communication server's receiver can handle. This might never be reported on some interfaces.
output errors	Sum of all errors that prevented the final transmission of datagrams out of the interface being examined. Note that this might not balance with the sum of the enumerated output errors, as some datagrams might have more than one error, and others might have errors that do not fall into any of the specifically tabulated categories.
collisions	Since a Token Ring cannot have collisions, this statistic is nonzero only if an unusual event occurred when frames were being queued or dequeued by the system software.
interface resets	Number of times an interface has been reset. The interface may be reset by the administrator or automatically when an internal error occurs.
restarts	Should always be zero for Token Ring interfaces.
transitions	Number of times the ring made a transition from up to down, or vice versa. A large number of transitions indicates a problem with the ring or the interface.

## show interfaces tunnel

To list tunnel interface information, use the **show interfaces tunnel** EXEC command.

**show interfaces tunnel** *unit* [**accounting**]

### Syntax Description

<i>unit</i>	Must match the interface port line number.
<b>accounting</b>	(Optional) Displays the number of packets of each protocol type that have been sent through the interface.

### Command Mode

EXEC

### Sample Display

The following example provides sample output from the **show interface tunnel** command:

```
cs# show interfaces tunnel 4

Tunnel4 is up, line protocol is down
  Hardware is Routing Tunnel
  MTU 1500 bytes, BW 9 Kbit, DLY 500000 usec, rely 255/255, load 1/255
  Encapsulation TUNNEL, loopback not set, keepalive set (10 sec)
  Tunnel source 0.0.0.0, destination 0.0.0.0
  Tunnel protocol/transport GRE/IP, key disabled, sequencing disabled
  Last input never, output never, output hang never
  Last clearing of "show interface" counters never
  Output queue 0/0, 0 drops; input queue 0/75, 0 drops
  Five minute input rate 0 bits/sec, 0 packets/sec
  Five minute output rate 0 bits/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 no buffer
    Received 0 broadcasts, 0 runts, 0 giants
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    0 input packets with dribble condition detected
    0 packets output, 0 bytes, 0 underruns
    0 output errors, 0 collisions, 0 interface resets, 0 restarts
```

Table 6-20 describes significant fields shown in the display.

**Table 6-20 Show Interfaces Tunnel Field Descriptions**

Field	Description
Tunnel is up   down	Interface is currently active and inserted into ring (up) or inactive and not inserted (down).
line protocol is {up   down   administratively down}	Shows line protocol up if a valid route is available to the tunnel destination. Shows line protocol down if no route is available, or if the route would be recursive.
Hardware	Specifies the hardware type.
MTU	Maximum transmission unit of the interface.
BW	Bandwidth of the interface in kilobits per second.
DLY	Delay of the interface in microseconds.

Field	Description
rely	Reliability of the interface as a fraction of 255 (255/255 is 100% reliability), calculated as an exponential average over five minutes.
load	Load on the interface as a fraction of 255 (255/255 is completely saturated), calculated as an exponential average over five minutes.
Encapsulation	Encapsulation method is always TUNNEL for tunnels.
loopback	Indicates whether loopback is set or not.
keepalive	Indicates whether keepalives are set or not.
Tunnel source	IP address used as the source address for packets in the tunnel.
destination	IP address of the host destination.
Tunnel protocol	Tunnel transport protocol (the protocol the tunnel is using). This is based on the <b>tunnel mode</b> command, which defaults to GRE.
key	ID key for the tunnel interface, unless disabled.
sequencing	Indicates whether the tunnel interface drops datagrams that arrive out of order. Can be disabled.
Last input	Number of hours, minutes, and seconds since the last packet was successfully received by an interface. Useful for knowing when a dead interface failed.
output	Number of hours, minutes, and seconds since the last packet was successfully transmitted by an interface.
output hang	Number of hours, minutes, and seconds (or never) since the interface was last reset because of a transmission that took too long. When the number of hours in any of the “last” fields exceeds 24 hours, the number of days and hours is printed. If that field overflows, asterisks are printed.
Last clearing	Time at which the counters that measure cumulative statistics (such as number of bytes transmitted and received) shown in this report were last reset to zero. Note that variables that might affect routing (for example, load and reliability) are not cleared when the counters are cleared. *** indicates the elapsed time is too large to be displayed. 0:00:00 indicates the counters were cleared more than $2^{31}$ ms (and less than $2^{32}$ ms) ago.
Output queue, drops Input queue, drops	Number of packets in output and input queues. Each number is followed by a slash, the maximum size of the queue, and the number of packets dropped due to a full queue.

Field	Description
Five minute input rate, Five minute output rate	<p>Average number of bits and packets transmitted per second in the last five minutes.</p> <p>The five-minute input and output rates should be used only as an approximation of traffic per second during a given five-minute period. These rates are exponentially weighted averages with a time constant of five minutes. A period of four time constants must pass before the average will be within two percent of the instantaneous rate of a uniform stream of traffic over that period.</p>
packets input	Total number of error-free packets received by the system.
bytes	Total number of bytes, including data and MAC encapsulation, in the error free packets received by the system.
no buffer	<p>Number of received packets discarded because there was no buffer space in the main system. Compare with ignored count. Broadcast storms on Ethernets and bursts of noise on serial lines are often responsible for no input buffer events.</p>
Received... broadcasts	Total number of broadcast or multicast packets received by the interface.
runt	Number of packets that are discarded because they are smaller than the medium's minimum packet size.
giants	Number of packets that are discarded because they exceed the medium's maximum packet size.
CRC	Cyclic redundancy check generated by the originating LAN station or far-end device does not match the checksum calculated from the data received. On a LAN, this usually indicates noise or transmission problems on the LAN interface or the LAN bus itself. A high number of CRCs is usually the result of a station transmitting bad data.
frame	Number of packets received incorrectly having a CRC error and a noninteger number of octets.
overrun	Number of times the serial receiver hardware was unable to hand received data to a hardware buffer because the input rate exceeded the receiver's ability to handle the data.
ignored	Number of received packets ignored by the interface because the interface hardware ran low on internal buffers. These buffers are different than the system buffers mentioned previously in the buffer description. Broadcast storms and bursts of noise can cause the ignored count to be increased.
abort	Illegal sequence of one bits on a serial interface. This usually indicates a clocking problem between the serial interface and the data link equipment.
packets output	Total number of messages transmitted by the system.

Field	Description
bytes	Total number of bytes, including data and MAC encapsulation, transmitted by the system.
underruns	Number of times that the far-end transmitter has been running faster than the near-end communication server's receiver can handle. This might never be reported on some interfaces.
output errors	Sum of all errors that prevented the final transmission of datagrams out of the interface being examined. Note that this might not balance with the sum of the enumerated output errors, as some datagrams might have more than one error, and others might have errors that do not fall into any of the specifically tabulated categories.
collisions	Number of messages retransmitted due to an Ethernet collision. This usually is the result of an overextended LAN (Ethernet or transceiver cable too long, more than two repeaters between stations, or too many cascaded multiport transceivers). Some collisions are normal. However, if your collision rate climbs to around 4-5%, you should consider verifying that there is no faulty equipment on the segment and/or moving some existing stations to a new segment. A packet that collides is counted only once in output packets.
interface resets	Number of times an interface has been reset. The interface may be reset by the administrator or automatically when an internal error occurs.
restarts	Number of times the controller was restarted because of errors.

### Related Commands

A dagger (†) indicates that the command is documented in another chapter.

**show ip route** †  
**show route** †

## show ip interface

To list a summary of an interface's IP information and status, use the **show ip interface** privileged EXEC command.

**show ip interface** [**brief**] [*type*] [*number*]

### Syntax Description

<b>brief</b>	(Optional) Displays a brief summary of IP status and configuration.
<i>type</i>	(Optional) Specifies that information be displayed about that interface type only. The possible value depends on the type of interfaces the system has. For example, it could be <b>ethernet</b> , <b>null</b> , <b>serial</b> , <b>tokenring</b> , and so on.
<i>number</i>	(Optional) Interface number.

### Command Mode

Privileged EXEC

### Sample Displays

The following is sample output from the **show ip interface** command:

```
Router# show ip interface
Ethernet0 is administratively down, line protocol is down
  Internet address is 1.0.46.10, subnet mask is 255.0.0.0
  Broadcast address is 255.255.255.255
  Address determined by setup command
  MTU is 1500 bytes
  Helper address is not set
  Directed broadcast forwarding is enabled
  Multicast groups joined: 224.0.0.1 224.0.0.2
  Outgoing access list is not set
  Inbound access list is not set
  Proxy ARP is enabled
  Security level is default
  Split horizon is enabled
  ICMP redirects are always sent
  ICMP unreachable are always sent
  ICMP mask replies are never sent
  IP fast switching is enabled
  IP fast switching on the same interface is disabled
  IP SSE switching is disabled
  Router Discovery is disabled
  IP accounting is disabled
  TCP/IP header compression is disabled
  Probe proxy name replies are disabled
  Gateway Discovery is disabled
PCbus0 is administratively down, line protocol is down
  Internet address is 198.135.1.43, subnet mask is 255.255.255.0
  Broadcast address is 255.255.255.255
  Address determined by setup command
  MTU is 1500 bytes
  Helper address is not set
  Directed broadcast forwarding is enabled
  Multicast groups joined: 224.0.0.1 224.0.0.2
```

```
Outgoing access list is not set
Inbound access list is not set

```

The following is sample output from the **show ip interface brief** command:

```
Router# show ip interface brief
Interface  IP-Address  OK?  Method  Status  Protocol
Ethernet0  1.0.46.10   YES  manual  administratively down  down
PCbus0     198.135.1.43  YES  manual  administratively down  down
Serial0    198.135.2.49  YES  manual  administratively down  down
```

The following is sample output from the **show ip interface brief pcbus 0** command:

```
Router# show ip interface brief pcbus 0
Interface  IP-Address  OK?  Method  Status  Protocol
PCbus0     198.135.1.43  YES  manual  administratively down  down
```

**Related Command**  
**show interfaces**

# show snapshot

To display snapshot routing parameters associated with an interface, use the **show snapshot** EXEC command.

**show snapshot** [*interface*]

## Syntax Description

*interface* (Optional) Interface type and number.

## Command Mode

EXEC

## Sample Display

The following is sample output from the **show snapshot** command:

```
Router# show snapshot serial 1

Serial1 is up, line protocol is up, snapshot up
Options: dialer support
Length of each activation period: 3 minutes
Period between activations:      10 minutes
Retry period on connect failure: 10
For dialer address 240
  Current queue: active, remaining active time: 3 minutes
  Updates received this cycle: ip, ipx, appletalk
For dialer address 1
  Current queue: client quiet, time until next activation: 7 minutes
```

Table 6-21 explains the fields in the display.

**Table 6-21 Show Snapshot Fields**

Field	Description
Serial1 is up, line protocol is up	Indicates whether the interface hardware is currently active (whether carrier detect is present) and if it has has been taken down by an administrator.
snapshot up	Indicates whether the snapshot protocol is enabled on the interface.
Options:	Options configured on the <b>snapshot client</b> or <b>snapshot server</b> interface configuration command. It can be one of the following: <ul style="list-style-type: none"> <li>dialer support—Snapshot routing is configured with the <b>dialer</b> keyword.</li> <li>stay asleep on carrier up—Snapshot routing is configured with the <b>suppress-statechange-update</b> keyword.</li> </ul>
Length of each activation period	Length of the active period.
Period between activations	Length of the quiet period.
Retry period on connect failure	Length of the retry period.
For dialer address	Displays information about each dialer rotary group configured with the <b>dialer map</b> command.

Field	Description
Current queue:	<p>Indicates which period snapshot routing is currently in. It can be one of the following:</p> <ul style="list-style-type: none"><li>• active—Routing updates are being exchanged.</li><li>• client quiet—The client router is in a quiet period and routing updates are not being exchanged.</li><li>• server quiet—The server router is in a quiet period, awaiting an update from the client router before awakening, and routing updates are not being exchanged.</li><li>• post active—Routing updates are not being exchanged. If the server router receives an update from the client router, it processes it but does not begin an active period. This allows time for resynchronization of active periods between the client and server routers.</li><li>• no queue—This is a temporary holding queue for new snapshot routing interfaces and for interfaces being deleted.</li></ul>
remaining active time time until next activation	Time remaining in the current period.
Updates received this cycle	Protocols from which routing updates have been received in the current active period. This line is displayed only if the router is in an active period.

## shutdown

To disable an interface, use the **shutdown** interface configuration command. Use the **no** form of this command to restart a disabled interface.

**shutdown**  
**no shutdown**

### Syntax Description

This command has no arguments or keywords.

### Default

Enabled

### Command Mode

Interface configuration

### Usage Guidelines

The **shutdown** command disables all functions on the specified interface. On serial interfaces, this command causes the DTR signal to be dropped. On Token Ring interfaces, this command causes the interface to be deinserted from the ring.

This command also marks the interface as unavailable. To check whether an interface is disabled, use the EXEC command **show interfaces**. An interface that has been shut down is shown as administratively down in the display from this command.

### Examples

The following example turns off Ethernet interface 0:

```
interface ethernet 0
shutdown
```

The following example turns the interface back on:

```
interface ethernet 0
no shutdown
```

### Related Command

**show interfaces**

## snapshot client

To configure a client router for snapshot routing, use the **snapshot client** interface configuration command. To disable a client router, use the **no** form of this command

**snapshot client** *active-time quiet-time* [**suppress-statechange-updates**] [**dialer**]  
**no snapshot client** *active-time quiet-time* [**suppress-statechange-updates**] [**dialer**]

### Syntax Description

<i>active-time</i>	Amount of time, in minutes, that routing updates are regularly exchanged between the client and server routers. This can be an integer in the range 5 to 100. There is no default value. A typical value would be 5 minutes.
<i>quiet-time</i>	Amount of time, in minutes, that routing entries are frozen and remain unchanged between active periods. Routes are not aged during the quiet period, so they remain in the routing table as if they were static entries. The argument <i>quiet-time</i> can be a value from 8 to 100000. There is no default value. The minimum quiet time is generally the active time plus 3.
<b>suppress-statechange-updates</b>	(Optional) Disables the exchange of routing updates each time the line protocol goes from “down” to “up” or from “dialer spoofing” to “fully up.”
<b>dialer</b>	(Optional) Allows the client router to dial up the remote router in the absence of regular traffic.

### Default

Snapshot routing is disabled.

The *active-time* and *quiet-time* arguments have no default values.

### Command Mode

Interface configuration

### Usage Guidelines

The value of the *active-time* argument must be the same for the client and server routers.

### Example

The following example configures a client router for snapshot routing:

```
interface dialer 1
 snapshot client 5 600 suppress-statechange-updates dialer
```

**Related Commands**

clear snapshot quiet-time

dialer map

show snapshot

snapshot server

## snapshot server

To configure a server router for snapshot routing, use the **snapshot server** interface configuration command. To disable a server router, use the **no** form of this command.

**snapshot server** *active-time* [**dialer**]  
**no snapshot server** *active-time* [**dialer**]

### Syntax Description

<i>active-time</i>	Amount of time, in minutes, that routing updates are regularly exchanged between the client and server routers. This can be an integer in the range 5 to 100. There is no default value. A typical value would be 5 minutes.
<b>dialer</b>	(Optional) Allows the client router to dial up the remote router in the absence of regular traffic.

### Default

Snapshot routing is disabled.

The *active-time* argument has no default value.

### Command Mode

Interface configuration

### Usage Guidelines

The value of the *active-time* argument must be the same for the client and server routers.

### Example

The following example configures a server router for snapshot routing:

```
interface dialer 1
 snapshot server 5
```

### Related Commands

**show snapshot**  
**snapshot client**

## systat

To display information about the active ports of the communication server, enter the **systat** EXEC command.

**systat** [**all**]

### Syntax Description

**all** (Optional) Displays information for both active and inactive ports.

### Command Mode

EXEC

### Example

The following example shows how to use the **systat** command:

```
cs> systat
```

Line	User	Host(s)	Idle	Location
0 con 0				
1 tty 1				charnel console
2 tty 2				T2500 #1-1
3 tty 3				T2500 #1-2
4 tty 4	xyz	LANE	56	T2500 #1-3
5 tty 5				T2500 #1-4
6 tty 6			3262	#A1
7 tty 7	train	ABC	0	3262 #B1
8 tty 8			3262	#A2
9 tty 9	pzwt	XRemote: 6 clients	0	3262 #B2

The information displayed includes the line number, connection name, idle time, and terminal location.

## transmitter-delay

To specify a minimum dead-time after transmitting a packet, use the **transmitter-delay** interface configuration command. Use the **no** form of this command to restore the default.

**transmitter-delay** *microseconds*  
**no transmitter-delay**

### Syntax Description

*microseconds*     Approximate number of microseconds of minimum delay after transmitting a packet on the MCI and SCI interface cards

### Default

0 microseconds

### Command Mode

Interface configuration

### Usage Guidelines

This command is especially useful for serial interfaces that can send back-to-back data packets over serial interfaces faster than some hosts can receive them.

The transmitter delay feature is implemented for the following Token Ring cards: CSC-R16M, CSC-1R, and CSC-2R. For the first four cards, the command syntax is the same as the existing command and specifies the number of milliseconds to delay between sending frames that are generated by the communication server. Transmitter delay for the CSC-CTR uses the same syntax, but specifies a relative time interval to delay between transmission of all frames.

### Example

The following example specifies a delay of 300 microseconds on interface serial interface 0:

```
interface serial 0
 transmitter-delay 300
```

## tunnel checksum

To enable encapsulator-to-decapsulator checksumming of packets on a tunnel interface, use the **tunnel checksum** interface configuration command. Use the **no** form of this command to disable checksumming.

**tunnel checksum**  
**no tunnel checksum**

### Syntax Description

This command has no arguments or keywords.

### Default

No tunnel checksumming

### Command Mode

Interface configuration

### Usage Guidelines

This command currently applies to generic route encapsulation (GRE) only. Some passenger protocols rely on media checksums to provide data integrity. By default, the tunnel does not guarantee packet integrity. By enabling end-to-end checksums, the communication servers will drop corrupted packets.

### Example

In the following example, all protocols will have encapsulator-to-decapsulator checksumming of packets on the tunnel interface:

```
tunnel checksum
```

## tunnel destination

To specify a tunnel interface's destination, use the **tunnel destination** interface configuration command. Use the **no** form of this command to remove the destination.

**tunnel destination** {*hostname* | *ip-address*}  
**no tunnel destination**

### Syntax Description

<i>hostname</i>	Name of the host destination
<i>ip-address</i>	IP address of the host destination

### Default

No tunnel interface destination is specified.

### Command Mode

Interface configuration

### Usage Guidelines

You cannot have two tunnels using the same encapsulation mode with exactly the same source and destination address. The workaround is to create a loopback interface and source packets off of the loopback interface.

### Example

In the following example, the tunnel destination is 131.222.111.234:

```
tunnel destination 131.222.111.234
```

### Related Command

**tunnel source**

## tunnel key

To enable an ID key for a tunnel interface, use the **tunnel key** interface configuration command. Use the **no** form of this command to remove the ID key.

**tunnel key** *key-number*  
**no tunnel key**

### Syntax Description

*key-number*                      Integer from 0 to 4294967295

### Default

Disabled

### Command Mode

Interface configuration

### Usage Guidelines

This command currently applies to generic route encapsulation (GRE) only. Tunnel ID keys can be used as a form of *weak* security to prevent misconfiguration or injection of packets from a foreign source.

---

**Note** When using GRE, the ID key is carried in each packet. We do *not* recommend relying on this key for security purposes.

---

### Example

In the following example, the tunnel key is set to 3:

```
tunnel key 3
```

## tunnel mode

To set the encapsulation mode for the tunnel interface, use the **tunnel mode** interface configuration command. To set to the default, use the **no** form of this command.

```
tunnel mode { aurp | cayman | eon | gre ip | mbone | nos }  
no tunnel mode
```

### Syntax Description

<b>aurp</b>	AppleTalk Update Routing Protocol (AURP)
<b>cayman</b>	Cayman TunnelTalk AppleTalk encapsulation
<b>dvmrp</b>	Distance Vector Multicast Routing Protocol
<b>eon</b>	EON compatible CLNS tunnel
<b>gre ip</b>	Generic route encapsulation (GRE) protocol over IP
<b>nos</b>	KA9Q/NOS compatible IP over IP

### Default

GRE tunneling

### Command Mode

Interface configuration

### Usage Guidelines

You cannot have two tunnels using the same encapsulation mode with exactly the same source and destination address. The workaround is to create a loopback interface and source packets off of the loopback interface.

Cayman tunneling implements tunneling as designed by Cayman Systems. This enables our routers to interoperate with Cayman GatorBoxes. With Cayman tunneling, you can establish tunnels between two routers or between our router and a GatorBox. When using Cayman tunneling, you must not configure the tunnel with an AppleTalk network address. This means that there is no way to ping the other end of the tunnel.

Use DVMRP when a router connects to a mrouter to run DVMRP over a tunnel. It is required to configure Protocol-Independent Multicast (PIM) and an IP address on a DVMRP tunnel.

Generic route encapsulation (GRE) tunneling can be done between our routers only. When using GRE tunneling for AppleTalk, you configure the tunnel with an AppleTalk network address. This means that you can ping the other end of the tunnel.

## Examples

The following example enables Cayman tunneling:

```
interface tunnel0
 tunnel source ethernet0
 tunnel destination 131.108.164.19
 tunnel mode cayman
```

The following example enables GRE tunneling:

```
interface tunnel0
 appletalk cable-range 4160-4160 4160.19
 appletalk zone Engineering
 tunnel source ethernet0
 tunnel destination 131.108.164.19
 tunnel mode gre ip
```

## Related Commands

**tunnel destination**

**tunnel source**

## tunnel sequence-datagrams

To configure a tunnel interface to drop datagrams that arrive out of order, use the **tunnel sequence-datagrams** interface configuration command. Use the **no** form of this command to disable this function.

```
tunnel sequence-datagrams
no tunnel sequence-datagrams
```

### Syntax Description

This command has no arguments or keywords.

### Default

Disabled

### Command Mode

Interface configuration

### Usage Guidelines

This command currently applies to generic route encapsulation (GRE) only. This command is useful when carrying passenger protocols that behave poorly when they receive packets out of order (for example, LLC2-based protocols).

### Example

In the following example, the tunnel is configured to drop datagrams that arrive out of order:

```
tunnel sequence-datagrams
```

## tunnel source

To set a tunnel interface's source address, use the **tunnel source** interface configuring command. Use the **no** form of this command to remove the source address.

```
tunnel source {ip-address | interface-type interface-number}
no tunnel source
```

### Syntax Description

<i>ip-address</i>	IP address to use as the source address for packets in the tunnel.
<i>interface-type</i>	All types.
<i>interface-number</i>	Specifies the port, connector, or interface card number. The numbers are assigned at the factory at the time of installation or when added to a system, and can be displayed with the <b>show interfaces</b> command.

### Default

No tunnel interface's source address is set.

### Command Mode

Interface configuration

### Usage Guidelines

You cannot have two tunnels using the same encapsulation mode with exactly the same source and destination address. The workaround is to create a loopback interface and source packets off of the loopback interface.

When using tunnels to Cayman boxes, you must set the **tunnel source** to an explicit IP address on the same subnet as the Cayman box, not the tunnel itself.

### Examples

In the following example, the tunnel source is set to the IP address assigned to Ethernet interface 0:

```
tunnel source ethernet 0
```

The following example enables Cayman tunneling:

```
interface tunnel0
tunnel source ethernet0
tunnel destination 131.108.164.19
tunnel mode cayman
```

The following example enables GRE tunneling:

```
interface tunnel0
appletalk cable-range 4160-4160 4160.19
appletalk zone Engineering
tunnel source ethernet0
tunnel destination 131.108.164.19
tunnel mode gre ip
```

**Related Commands**

**tunnel destination**

**tunnel source**

## tx-queue-limit

To control the number of transmit buffers available to a specified interface on the MCI and SCI cards, use the **tx-queue-limit** interface configuration command.

**tx-queue-limit** *number*

### Syntax Description

<i>number</i>	Maximum number of transmit buffers that the specified interface can subscribe
---------------	---

### Default

Defaults depend on the total transmit buffer pool size and the traffic patterns of all the interfaces on the card. Defaults and specified limits are displayed with the **show controllers mci EXEC** command.

### Command Mode

Interface configuration

### Usage Guidelines

Only use this command under the guidance of a technical support representative.

### Example

The following example sets the maximum number of transmit buffers on the interface to 5:

```
interface ethernet 0
tx-queue-limit 5
```

### Related Command

**show controllers mci**
