

# Prepare to Configure from a UNIX Workstation

---

From a UNIX workstation or PC, you cannot use ClickStart to configure your router for the first time because the router cannot discover its IP address. Instead, you must configure the router's IP address when you Set Up the Router as follows:

- 1 Connect a terminal to the router's console port.
- 2 Configure an IP address for the router's Ethernet port.

<HR>

Continue with the next step in the process.
