

ATM Connections

The ATM commands apply to activating and configuring ATM connections and statistical reporting for these connections. ATM trunks are physical lines that connect to BPX nodes and support ATM connections. ATM connections on a BPX require the use of either an ASI or BNI front card and a back card that supports T3, E3, or OC3 (STM1). The following lists the permissible card combinations for BPX lines.

Table 10-1

Application	Front Card	Back Card
ATM	BNI-T3	LM-3T3 (Three ports)
ATM	BNI-E3	LM-3E3 (Three ports)
ATM	ASI-T3	LM-2T3 (Two ports)
ATM	ASI-E3	LM-2E3 (Two ports)
ATM	ASI-155	MMF-2-BC
ATM	ASI-155	SMF-2-BC
ATM	ASI-155	SMF LR-2-BC
ATM	BNI-155	MMF-2-BC
ATM	BNI-155	SMF-2-BC
ATM	BNI-155	SMF LR-2-BC

Setting Up an ATM Connection

To set up an ATM connection, perform the following steps:

- Step 1** Activate the ATM port with the **upport X.X** command, where X.X is the shelf slot and port (1–4) of the ATM card set.
- Step 2** Use the **cnfport** command to establish the characteristics for the ATM port.
- Step 3** If a suitable class is already configured, note its number and use this class when adding the ATM connection with the **addcon** command. (The **dspcls** command displays the parameters for each connection class. The **cnfcls** command allows an individual class to be modified.)
- Step 4** Use the **vt** command to log in to the node at the remote end of the proposed ATM connection.
- Step 5** At the remote node, use the **upport** and **cnfport** as listed in steps 1 and 2 to activate and configure the remote port.
- Step 6** Use the **addcon** command at one end of the connection to activate the ATM connection.

Managing Bandwidth

There are a number of commands that assist in managing bandwidth to achieve satisfactory traffic patterns.

cnfpref	The configure preference command can be used to specify preferred routing for intra-domain connections. This command can be used to assist in balancing the load on the network's trunks.
dsprts, prttrs	The display and print routes commands can be used in conjunction with the cnfpref command to display the current connection routing information.
upcon, dncon	The up and down connection commands can be used to temporarily down connections, thus releasing bandwidth for other services. Often it is possible to down some voice connections to provide more bandwidth for data, frame relay, or ATM traffic.

Other Commands

The following commands may be useful for establishing connections.

- **delcon** deletes a connection from an ATM line.
- **dnln** downs a line. A downed line is deactivated with no drive signals and no statistics. All connections on the line must be deleted (**delcon**) before a line can be downed.
- **dspcons** displays the connections on a specified ATM line.
- **dsplns** displays the line configuration and alarm status for the node.
- **dsplnutl** displays the line utilization for an ATM line.

Summary of Commands

The commands discussed in the previous sections are summarized in the following table.

Table 10-2

Mnemonic	Description	Page
addcon	Add connection	10-4
addcongrp	Add connection group	10-14
clrchstats	Clear channel statistics	10-16
cnfcls	Configure class	10-18
cnfconsc	Configure connection	10-22
cnfln	Configure line	10-24
cnfport	Configure port	10-26
cnfportq	Configure port queue	10-29
delcon	Delete connection	10-31
delcongrp	Delete connection group	10-33
dnln	Down line	10-35
dnport	Down port	10-37
dspchstats	Display channel statistics	10-39
dspcls	Display class	10-41
dspcon	Display connection	10-43
dspconcnf	Display connection configuration	10-47
dspcongrp	Display connections in a group	10-49
dspcongrps	Display connection groups	10-51
dspcons	Display connections	10-53
dsplmistats	Display LMI statistics	10-57
dsplncnf	Display line configuration	10-59
dsplns	Display lines	10-61
dspport	Display port	10-63
dspportq	Display port queue	10-66
dspportstats	Display Port Statistics	10-68
grpcon	Group a connection	10-70
prtlns	Print lines	10-72
upln	Up line	10-73
upport	Up port	10-75

addcon

Establish an ATM connection for a channel between the current node and one or more nodes in the network. You can specify a port on either an ASI, BNI, BTM, or AIT front card. For a description of the **addcon** command as it applies to frame relay connections, voice connections, or data connections, refer to the chapter that applies to the specific connection type. When used with the syntax in this chapter, **addcon** adds either a standard ATM connection, a frame relay-to-ATM interworking connection (ATFR), or a frame relay-to-ATM interworking with ForeSight (ATFST) connection.

The node on which **addcon** executes is the “owner” of the connection. Connection ownership is important because automatic rerouting and preferred routing information for a connection is entered on the node that owns the connection. See the **cnfpref** and **cnfcos** descriptions for information on automatic rerouting.

The displayed parameter prompts depend on the connection type. Before a connection is added, the proposed connection appears on the screen with a prompt for confirmation. After **addcon** executes, the system software automatically routes the connection. The figures on this and the following pages are flow diagrams showing the sequence of possible parameter prompts according to the connection type and whether Usage Parameter Control (UPC) is enabled. The flow diagrams begin after the remote node name and VPI and VCI have been entered. The subsequent tables define the parameters and list the defaults and ranges for each parameter. Refer to the *System Manual* and the ATM Forum specifications for more details on ATM parameters and concepts such as the *leaky buckets* for controlling cell admissions to the network.

A form of notation appears for some parameters that may need explanation. The notation is either (0), (1), or (0+1). This refers to the state of the Cell Loss Priority (CLP) bit. The usage of the CLP bit is in the traffic policing schemes. (0+1) means cells with CLP=0 or 1. (0) means cells with CLP=0. (1) means cells with CLP=1. The CLP bit is used in different contexts. For example, CDVT (0+1) refers to Cell Delay Variation Tolerance (CDVT) for cells with CLP=0 or 1. CDVT (0) means CDVT for cells with CLP=0. PCR(0) means PCR for cells with CLP=0. For a description of CLP and CDVT usage and policing concepts in general, refer to the *System Manual* and the ATM Forum specifications.

Figure 10-1 Prompt Sequence for a CBR Connection

Figure 10-2 Prompt Sequence for a VBR/ATFR Connection

Figure 10-3 Prompt Sequence for a ABR/ATFST Connection

The following table contains descriptions of the ATM parameters that appear on screen. The subsequent table gives the defaults, ranges (or values), and granularity for each parameter. The last section contains screen examples. The preceding flow diagrams help clarify the information in these forthcoming sections.

Note If the description states the parameter is transmit/receive, the system is prompting for two values: one is for the transmit direction, the other for the receive direction. Also, not all parameters apply to OC3/STM1, as the text shows.

Table 10-3 addcon – Parameters

Parameter/Prompt	Description
local channel	Specifies the local slot, port, virtual path identifier (vpi), and virtual connection identifier (vci) for the connection. The format is <i>slot.port.vpi.vci</i>. The vpi and vci ranges are: The vpi range for a UNI connection is 0–255. The vpi range for an NNI connection is 0–1023 The range for a vci is 1–4095. The vci can be an asterisk (*) to indicate the connection is a <i>virtual path</i> (the vci does not provide a distinction within the network).
remote node name	Specifies the name of the node at the other (or remote) end of the connection.

Parameter/Prompt	Description
remote channel	Specifies the remote node's slot, port, vpi, and vci for this connection. The format is <i>slot.port.vpi.vci</i>. The vpi and vci ranges are: The vpi range for a UNI connection is 0–255. The vpi range for an NNI connection is 0–1023 The range for a vci is 1–4095. The vci can be an asterisk (*) to indicate the connection is a <i>virtual path</i> (the vci does not provide a distinction within the network).
connection class	Specifies one of the following connection types: VBR, CBR, ABR, ATFR (VBR with ATM-to-frame relay interworking), or ATFST (ABR with interworking and ForeSight). The parameters that follow this selection depend on the chosen connection type. Refer to the flow diagrams on the preceding pages. The option for choosing a class <i>number</i> is also available. The class is a <i>template</i> for a connection type. This serves as an alternative to specifying each parameter for a connection type. To specify a connection class, enter a digit in the range 1–10. To see the parameter values for a class, use the dspcls commands. To customize any class template, use cnfcls.
ABR	T3/E3: Enables/disables ForeSight. Refer to the flow diagrams on the preceding pages for help with the following explanation: If the connection type selected at the “connection class” prompt was VBR and ABR is <i>enabled</i> at this prompt, the connection type changes to ABR, and prompts for ABR parameters subsequently appear. On the other hand, if the selected connection type is ABR and ABR is <i>disabled</i> at this ABR prompt, the connection type changes to VBR, so only VBR parameters are requested.
PCR(0+1)	T3/E3: Specifies the transmit/receive Peak Cell Rate (PCR) for cells leaving the first leaky bucket on the ASI card with CLP(0+1). Applies to only CBR connections. OC3 (STM1): Specifies the transmit/receive Peak Cell Rate (PCR). The range is 10 cps up to the maximum line rate. (See table of defaults and ranges.)
UPC	T3/E3 or OC3 (STM1): Enables/disables Usage Parameter Control (UPC). With UPC, additional user-specified parameters become available for each connection type. Refer to the preceding flow diagrams to see the parameters available for each connection type. The system uses the default if no parameter change occurs. See next table for defaults.
FGCRA	T3/E3: Enables either the Frame-Based Generic Cell Rate Algorithm (FGCRA) or the standard GCRA (the default). FGCRA controls automatic cell discarding (or tagging) of the remainder of a frame when one cell from the frame is non-compliant. FGCRA is a StrataCom enhancement of the ATM-UNI Generic Cell Rate Algorithm (GCRA) for associating a cell with the frame from which it originated. StrataCom supports configuration on a per-connection basis.
CDVT(0+1)	T3/E3 or OC3 (STM1): Specifies the transmit/receive Cell Delay Variation Tolerance (CDVT) for the <i>first</i> leaky bucket, which applies to cells with CLP(0+1). CDVT is the maximum time for accumulated violations of cell-arrival time parameters.
PCR(0)	T3/E3: Specifies the transmit/receive Peak Cell Rate (PCR) for cells leaving the second leaky bucket [CLP(0)] on the ASI card. OC3 (STM1): PCR(0) not used by ASI-2 OC3 (STM1).

Parameter/Prompt	Description
CDVT(0)	T3/E3: Specifies the transmit/receive Cell Delay Variation Tolerance (CDVT) for the second leaky bucket. The <i>second</i> bucket applies to cells with CLP(0). CDVT is the maximum time for accumulated violations of cell-arrival time parameters. OC3 (STM1): CDVT(0) not used by ASI-2 OC3 (STM1) card.
SCR policing	T3/E3: Specifies the traffic policing for a VBR or ABR connection. The possible policing configurations are SCR policing of CLP (0+1) (which is selected as SCR#2), SCR policing of CLP(0) (which is selected as SCR#1), or SCR policing off (SCR#3). The SCR Policing parameter is not used by ASI-2 OC3 (STM1) card.
SCR	T3/E3: Sustainable Cell Rate (SCR) specifies a compliant cell rate threshold for transmit/receive. SCR is available with ABR and VBR connections and is less than or equal to the Peak Cell Rate (PCR). The ASI-2 OC3 (STM1) card does not use SCR policing.
MBS	T3/E3 or OC3 (STM1): The transmit/receive Maximum Burst Size for SCR policing.
CLP tagging	T3/E3 and OC3 (STM1): Enables/disables Cell Loss Priority (CLP) tagging. If CLP tagging is enabled, the CLP bit is set as a result of a UPC violation.
MCR	T3/E3: Specifies the transmit/receive Minimum Cell Rate (MCR) for ABR connections.
ICR	T3/E3: Specifies the transmit/receive Initial Cell Rate. ICR is the rate that occurs after a period of inactivity on an ABR connection. (This period is the value of ICR TO). The cell rate then goes up or down under the control of the ForeSight Rate Control Algorithm. The range is 0 cps through the line's maximum. The ICR default is a range under the control of the ForeSight Rate Control Algorithm. See also the descriptions of Rate Up and Rate Dn.
ICR TO	T3/E3: ICR timeout. Specifies a period of inactivity before a connection's cell rate is reset to the specified ICR.
Rate Up	T3/E3: Specifies the increment in cell rate when the rate goes up. This ForeSight Rate Up increment is in cells per second per adjustment.
Rate Dn	T3/E3: Specifies large reductions in the transmit/receive cell rate. This ForeSight Rate Down value is a percentage of the current rate.
Rate FastDn	T3/E3: Specifies a rate of decrease in the transmit/receive cell rate when ForeSight quickly adjusts the rate down. This value is a percentage of the SCR.
Minimum Adjust	T3/E3: Minimum Adjust Period specifies the interval before the ingress sends rate adjustments for ABR connections. This is the time period before either a rate adjustment is made or a message is sent that an adjustment is not necessary. It serves as a stand-in round trip delay until a true RTD is measured. Older software refers to this as Maximum Adjust Rate.
VC Qdepth	T3/E3: Specifies the maximum ABR VC queue depth for transmit/receive.
EFCI	T3/E3: The transmit/receive percent of ABR VC queue depth that causes EFCI to be set.
CLP Hi	T3/E3: Specifies a percent of the transmit/receive ABR VC queue depth. When a transmit/receive threshold is exceeded, the node discards cells with CLP=1 in the connection until the VC queue level falls below the depth specified by CLP lo.
CLP Lo	T3/E3: Specifies a percent of the transmit/receive ABR VC queue depth such that, when the VC queue level falls below this level, the node stops discarding CLP=1 cells.
IBS	T3/E3: Initial Burst Size (IBS) for transmit/receive. Applies to only ABR connections.

Parameter/Prompt	Description
RM	T3/E3: Enables Resource Management cells to go to a port on an ASI. RM cells provide backwards congestion notification, which subsequently goes to external equipment. For BNI cards, leave RM disabled. In older software, the name of this parameter is BCM.
% Util	T3/E3: Specifies the percent of bandwidth utilization for a connection. Bandwidth allocation based on %util depends on the connection type, as follows: For CBR, the default is 100%, and the bandwidth allocation is $PCR(0+1) * \%util$. For VBR, the default prompt is the <i>minimum</i> of either 100% or $120(SCR/PCR)$. The bandwidth allocation is $PCR(0+1) * \%util$. For ABR, the default is 100%. The bandwidth allocation is $MCR * \%util$.

Table 10-4 addcon – Parameter Defaults and Ranges

Parameter	Range or Value	Default	Dependency	Granularity
ABR	enable/disable	VBR: disable ATFR: disable ABR: enable ATFST: enable		n/a
PCR(0+1)	PCR in cells/sec 7–96000: T3 7–80000: E3 7–353200: OC3 (STM1)	10	Range is limited to 7–5333 cps for ATF connections.	10 cps
UPC	enable/disable	enable		n/a
FGCRA	enable/disable	disable		n/a
CDVT(0+1)	CDVT, in microsecs. 0-250000: T3/E3 and OC3/STM1	CBR: 10000 All others: 250000		1 microsec.
PCR(0)	PCR in cells/sec 7–96000: T3 7–80000: E3	PCR(0+1)	PCR(0) <= PCR(0+1).	10 cps
CDVT(0)	CDVT uSec 0-250000: T3/E3	CDVT(0+1)		1 microsec.
SCR policing	1-3 1 = CLP(0) 2 = CLP(0+1) 3 = Off	1		n/a
SCR	SCR in cells/sec 7–96000: T3 7–80000: E3 7–353200: OC3/STM1	Value of PCR(0+1)	SCR <= PCR(0+1). Range is limited to 7–5333 cps for ATF connections. Upper limit = max line rate.	10 cps
MBS	MBS in cells 1–24000: T3/E3 10–1000: OC3 (STM1)	1000		1 cell
CLP tagging	enable/disable	enable	For SCR Policing CLP(0+1), tagging always disabled	n/a
MCR	MCR in cells/sec 0–96000: T3 0–80000: E3	ABR: 0 ATFST: 10	MCR <= PCR(0+1). Range is limited to 7–5333 cps for ATFST cons.	10 cps
ICR	ICR in cells/sec 0–96000: T3 0–80000: E3	Maximum of: MCR or PCR(0+1)/10	ICR >= MCR and ICR <= PCR(0+1). Range is limited to 7–5333 cps for ATFST connections.	10 cps
ICR time out	1–255 Seconds	10		1 second

Parameter	Range or Value	Default	Dependency	Granularity
Rate up increment	In Cells/Sec/Adjust 10–96000	Maximum of: 10% of MCR or 2000		10 cells
Rate down	1–100%	87%		1%
Rate fast down	1–100%	50%		1%
Min. adjust period	20–250 msec	40		10 msec
VC Qdepth	ABR: 1–64000 cells ATFR: 1-1366	ABR: 16000 ATFR: 1366	Does not apply to OC3/STM1	1 cell
EFCI threshold	1–100% of VC queue depth	100%		1%
CLP high threshold	1–100% of VCqueue depth	90%		1%
CLP low threshold	1-100% of VCqueue depth	80%		1%
IBS	ABR: 0–24000 cells ATFR: 1–107 cells	0		1 cell
RM	enable/disable	disable		n/a
% utilization	1–100%	CBR:100% ABR:100% VBR: min. of: 120% * (SCR/PCR(0+1)) or 100%	VBR default: minimum of: 120% * (SCR/PCR(0+1)) or 100%	1%

Full Name

Add a connection

Syntax

addcon *parameters* (see preceding flow diagrams and tables)

Related Commands

delcon, dspcons

Attributes

Privilege	1–2
Jobs	Yes
Log	Yes
Node	IPX, IGX, BPX
Lock	Yes

Example 1

addcon 4.1.2.1 sw53 4.1.2.2

Description

Add a connection between 4.1.2.1 on node swstorm and 4.1.4.2 on node sw53.

System Response

swstorm	TN	StrataCom	BPX 15	8.2	July 26 1996 20:05 GMT
Local	Remote	Remote			Route
Channel	NodeName	Channel	State	Type	Avoid COS 0
4.1.2.1	sw53	4.1.4.2	Ok	atfr	0 L

This Command: addcon 4.1.2.1 sw53 4.1.4.2 atfr * * * * *

Add these connections (y/n)?

Example 2

addcon 3.2.9.251 nmsbpx04 5.2.7.251 (with defaults illustrated)

In this case, the screen shows the value for each parameter entered on the command line.

System Response

nmsbpx03	TN	StrataCom	BPX 15	8.2	Nov. 3 1996	18:02 PDT
Local	Remote	Remote			Route	
Channel	NodeName	Channel	State	Type	Avoid COS 0	
3.2.9.251	nmsbpx04	5.2.7.251	Ok	abr	0 L	

This Command: addcon 3.2.9.251 nmsbpx04 5.2.7.251 abr e 10 10 1000 e 10 10 10 10
110 87 50 100 64000 100 100 d e 100 90 e

Add these connections (y/n)?

addcongrp

Sets up a group to which ATM connections between the local node and a remote node are added. The connection group is a routing entity that is initially empty and to which individual connections (virtual circuits) are added using the **grpcon** command. Connections added to a group must be of the inter-node, non-bundled, ATM type. The connections must have the same routing parameters. These parameters include connection owner, class of service (COS), connection state, route restrictions, and ForeSight enable status.

Connection grouping permits an IPX or IGX node to have up to 1000 connections and a BPX node to have up to 5000 connections. A connection group may have up to 16 connections.

Full Name

Add connection group

Syntax

addcongrp <remote node> [.group number]

Related Commands

grpcon, delcongrp, dspcongrp, dspcongrps

Attributes

Privilege	1–2
Jobs	Yes
Log	Yes
Node	IPX, IGX, BPX
Lock	Yes

Example 1

addcongrp bpx4

Description

Add a connection group to node bpx4. The system adds the connection and automatically creates the group name with the “.1” appended to the remote node name.

System Response

```

bpx1          TN      StrataCom      BPX 15      8.2      Feb. 14 1996 19:53 PST

Only to
bpx4          Count  State  Route
bpx4.1        0      Local

```

Last Command: addcongrp bpx4

Next Command:

Table 10-5 addcongrp – Parameters

Parameter	Description
remote node name	Specifies the name of the remote node to which the grouped connections are routed.

Table 10-6 addcongrp – Optional Parameters

Parameter	Description
.number	Users have the option of specifying the appended group number. Without a user-specified number, the system assigns the next available number.

clrchstats

Clears the gathered statistics for either a specific channel or all channels. When you enter a specific channel number, a display of the current channel statistics appears. The display asks if you confirm the choice for clearing. If you enter “*” (all channels) for the channel specification, the display prompts you to confirm the decision to clear all channel statistics.

Full Name

Clear channel statistics

Syntax

clrchstats <channel | *>

Related Commands

dspchstats

Attributes

Privilege	1–2
Jobs	Yes
Log	Yes
Node	IPX, IGX, BPX
Lock	Yes

Example 1

clrchstats 3.1.1

Description

Clear channel statistics for 3.1.1.

System Response

```

This Command: `cnfcls 1`

Enter class type (VBR, CBR, ABR, ATFR):

Table 10-8 **cnfcls – Parameters**

Parameter	Description
class	Specifies the class to configure. The class numbers are 1–10.

Table 10-9 **cnfcls – Optional Parameters**

Parameter	Description
optional parameters	Individual parameters are specific to the type of connection (CBR, VBR, ABR, ATFR). Use the dspcls command to see the parameters in each of the classes.

cnfcon

Configures the ATM bandwidth parameters for a specified connection. The initial cell rate (ICR) normally is set to the port speed. It may be lower if other constraints exist on the data generation rate. If ICR is too low, cells are dropped. If it is too high, bandwidth may be wasted unless ForeSight is used. Statistical reports are the best source of information for deciding what to adjust.

If the connection type includes ForeSight (abr enabled), the results of the last test round trip delay command (**tstdelay**) appear. Note that this is not the current RTD but the result of the last test that ran. Connection priority — high or low — is displayed for standard frame relay connections and ForeSight connections. Several checks are done on the parameters that specify bandwidth to assist users in efficient use of network bandwidth. The following messages describe the performance evaluation.

- Error Min cannot exceed peak.
- Warning Min exceeds this port's speed.
- Warning Sum of mins exceeds port's speed.
- Warning Peak exceeds this port's speed.

Warning messages are informational only, so the related operation continues. If an error message appears, the operation does not continue.

This Command: cnfcon 12.1.1.6

MBS (10) must exceed IBS (10)
Enter the MBS [10/10]:

Table 10-10 **cnfcon – Parameters**

Parameter	Description
channel	Specifies the connection to configure. This command configures one connection at a time. The channel specification has the following format: slot.port.vpi.vci

Table 10-11 **cnfcon – Optional Parameters**

Parameter	Description
bandwidth parameters	Refer to the addcon command in this chapter for descriptions and connection types.

cnfcondsc

Assigns a user-specified, reference description to a connection. The connection descriptor is independently configurable at each end of a connection. To remove a descriptor, enter this command and specify a null descriptor. A descriptor cannot be deleted in a job, just reconfigured. The **dspcon** and **dspcons +d** commands display any existing connection descriptors.

Full Name

Configure connection description

Syntax

cnfcondsc <channel> <descriptor>

Example 1

cnfport 12.1 N N N H N N

Description

Configure port 12.1 to have an UNI cell header format; not to be an AXIS shelf; not to have a Metro Cell Header format; shift on HCF; use no protocol; and not to apply %util.

System Response

```

batman          TN      StrataCom      BPX 15      8.2      Date/Time Not Set

Port:           12.1
Interface:      T3-2
Type:           UNI                      %Util Use:      Disabled
Speed:          96000
Shift:          SHIFT ON HCF (Normal Operation)
VBR Queue Depth: 1000

Protocol:       NONE

```

Last Command: cnfport 12.1 N N N H N N

Next Command:

Table 10-14 **cnfport – Parameters**

Parameter	Description
slot.port	Specifies the ASI card slot and port number.
nni/uni	Specifies whether the cell header format is NNI or UNI.
axis	Specifies AXIS queue depth for each slot.
metro data cell header	Specifies whether the metro data cell header type is used.
shift h n	Specifies whether a one-byte shift on the HCF field of the cell header occurs. The choice of H (shift) or N (no shift) depends on whether the ATM cloud includes non-StrataCom nodes and whether virtual trunking is in operation: Select H (the default) if the cloud includes non-StrataCom nodes or if only a physical trunk is configured for the ASI port. Select N if virtual trunks are configured <i>and</i> the ATM cloud consists of StrataCom nodes only.
protocol	Specifies the use of either an LMI protocol, an protocol, or no specified protocol.

Parameter	Description
%util	Enables/disables percent utilization. This parameter supports ATM VBR/ABR fairness for ASI terminated connections and applies to only VBR and ABR connections. To change the %util status of a port, no connections can be currently terminating on the port. Therefore, if connections terminate on the port, they must be deleted before cnfport execution then re-added after execution of cnfport. When this feature is disabled, the port queue bandwidth is calculated using the sum of the MCRs or PCRs for the connections terminating on the port. This is identical to the port queue bandwidth calculation prior to the implementation of the %util feature. The port queue bandwidth with %util feature <i>disabled</i> is: • For ABR connections Port Queue BW = sum (MCR) • For VBR connections Port Queue BW = sum (PCR) • For CBR connections Port Queue BW = sum (PCR) When the %util feature is enabled, the port queue bandwidth is calculated for ABR and VBR connections as follows: for ABR connections, the port queue bandwidth is the sum of a percentage of the MCRs for the connections terminating on the port; for VBR connections, the port queue bandwidth is the sum of a percentage of the PCRs for connections terminating on the port. The feature is not applied to CBR connections. In summary, the port queue bandwidth with feature %util <i>enabled</i> is: • For ABR connections Port Queue BW = sum (MCR * %util) • For VBR connections Port Queue BW = sum (PCR * %util) For CBR connections Port Queue BW = sum (PCR)

cnfportq

Configures queue parameters for a port on an ASI card. Pressing the Return key keeps the current value for the parameter.

Full Name

Configure port

Syntax

dspcon

Displays connection information for a specified channel. The information displayed includes:

- The channel numbers for both the local and remote ends of the connection.
- The node names at both ends of the connection.
- The type or data rate of the connection.
- The routing restriction.
- The class of service (COS) of the connection.
- The connection route, listing the end nodes and any intermediate nodes.
- The preferred route for the connection (if configured).
- The status of the cards associated with the connection.
- Any Y-cable conflicts.
- The compression status.
- The connection bandwidth parameter values.
- The connection/type descriptor (if configured).
- The circuit round trip delay (if ForeSight is enabled).

Any failures that affect the connection flash on the screen. For frame relay NNI ports, the NNI value indicates the A-bit value received across the NNI from the remote network. The status that may be displayed includes:

OK	Connection OK
FAILED	Connection failed
MISSING	VPI.VCI was deleted in other network at NNI. A previous status report indicated a valid VPI.VCI present but an updated report did not.
UNUSED	indicates the UNI port does not support reporting of NNI A-bit status

Table 10-23 dspcon – Parameters

Parameter	Description
channel	Specifies the channel for which to display connection details. The command displays connection information for one channel at a time. You cannot specify a set of channels. Channel is specified in the following format: slot.port.vpi.vci

dspconcnf

Displays the following information for a connection's configuration:

- The channel numbers for both the local and remote ends of the connection.
- The node names at both ends of the connection.
- The preferred route for the connection (if configured).
- The bandwidth parameter values for ATM connections.
- VC queue depth.
- The connection type (if configured).
- Other values (see example screen).

Table 10-24 dspconcnf – Parameters

Parameter	Description
channel	Specifies the channel for which to display connection configuration. The command displays connection information for one channel at a time. You cannot specify a set of channels. Channel is specified in the following format: slot.port.vpi.vci

dspcongrp

Displays the connections in a particular group. The information displayed consists of:

- Each connection in the group
- The node name at the remote end of the connection
- The state of the connection
- The connection type
- The routing restriction (route avoid)
- The class of service (COS) of the connection
- The owner of the connection

Failures that affect a connection appear flashing on screen. For frame relay NNI ports, the NNI value indicates the A-bit value received across the NNI from the remote network.

Table 10-25 dspcongrp – Parameters

Parameter	Description
group	Specifies the group whose members are listed. The name can be obtained from the dspcongrps command.

dspcongrps

Displays a list of all grouped connections on the current node. The optional parameter narrows the scope of the list to grouped connections either on a named node or in a named group. The displayed information consists of:

- The node name and the count that each group represents for that node
- The number of connections in each group
- The state of the connection group
- Any specified route to avoid
- The Class of Service for the group
- Whether the connections have ForeSight
- Whether the owner of the group is a remote node or the local node

Next Command:

Table 10-26 dspcongrps – Optional Parameters

Parameter	Description
node name or group name	Restricts the groups displayed to either a node name or a connection group name.

dspcons

Displays information about the connections on an IPX, IGX, or BPX node. (For information about **dspcons** for an AXIS card, refer to the *AXIS Command Supplement*.)

The following table lists all possible information headings that appear in the display. The actual headings that appear depend on the choice of selected optional parameters—including no parameters. The screen examples reflect various optional parameters.

Note This description shows all parameters that are displayed even though some parameters are meaningless on a BPX.

Table 10-27

Fields	Description								
Local Channel	The connection's channel at this node.								
Remote Node Name	The name of the node at the other end of the connection.								
Remote Channel	The connection's channel at the remote node.								
State	The state of the connection(s) are as follows. <table> <tr> <td>State</td><td>Paramter</td></tr> <tr> <td>OK</td><td>routed</td></tr> <tr> <td>Down</td><td>downed</td></tr> <tr> <td>Failed</td><td>unrouted, but trying</td></tr> </table>	State	Paramter	OK	routed	Down	downed	Failed	unrouted, but trying
State	Paramter								
OK	routed								
Down	downed								
Failed	unrouted, but trying								
Type	The type of connection (vbr, cbr, abr, atfr, or atfst).								
Route Avoid	The type of lines to avoid when routing (satellite lines, terrestrial lines, lines with zero code suppression).								
COS	The Class Of Service.								
Owner	The end of the connection in control of re-routing.								

Full Name

Display connections

Syntax

`dspcons [start_channel] [nodename] [+d] [-f] [-v] [-d] [-g] [-atfr] [-abit] [-fabit] [-fail] [-down]`

where

<i>start_channel</i>	is the starting channel to display
<i>nodename</i>	specifies that connections for only the named node appear in the display
+d	equals display the connection's optional descriptor specified by the cnfcondsc command
-f	equals display frame relay connection only
-v	equals display only voice connections

-d	equals display only data connections and do so in Kbps.
-g	equals display only grouped connections
-atfr	equals frame relay to ATM interworking connections (also displays atfr with ForeSight)
-abit	equals show status of the A-bit
-fabit	equals show only connections with failed A-bits
-down	equals show only downed connections

Note NOTE: Some parameters may supersede other parameters.

Table 10-29 dsplmistats – Parameters

Parameter	Description
channel	Channel is specified in the following format <i>slot.port</i>

dsplncnf

Displays the current configuration of the specified line. The following table contains the configuration parameters in the display.

Table 10-30

Parameter	Description	Possible Value
LN Configuration:	The line type and the number of channels.	T1 or E1
Loop clock:	Whether the receive clock is looped back to the transmit clock.	Y or N
Line framing:	The type of T1 line framing used.	DS4 or ESF
Line coding:	The type of line coding used. The types used vary between T1 and E1 lines.	HDB3 or AMI (E1) ZCS, B8ZS, or AMI (T1)
CRC:	CRC checking on E1 lines.	Y or N
recv impedance:	The nominal receive line impedance (for E1 lines only)	75 ohms balanced or unbalanced, or 120 ohms balanced
E1 signalling:	Signalling type used (for E1 lines only).	CAS or CCS
encoding:	Voice encoding scheme.	μlaw or Alaw
T1 signalling:	The T1 signalling bit pattern used.	ABCD, ABAB, AB
Cable type:	The T1 or E1 cable type used (for equalization)	MAT or ABAM
Cable length:	The T1 or E1 cable length in feet to the CSU or digital crossconnect.	0-220, 220-440, 440-655, 0-133, 133-266
56 kbps Bit Pos:	Position in word for bit stuffing on 56 kbs data channels.	MSB or LSB

dspport

Displays one of three choices; the state of all ATM ports in a node, general information on all four ports on a selected ASI card, or detailed status on a single specified ATM port. The more specific the port address in the command, the more detail is provided. The following are examples of the **dspport** command:

- dspport displays states of all ATM ports in the node
- dspport 8 displays the port states for ASI in slot 8
- dspport 8.1 displays the configuration for port 1 of the ASI in slot 8

A full description of these parameters is provided in the **cnfport** command.

Next Command:

Table 10-33 dspportq – Optional Parameters

Parameter	Description
slot or slot.port	Specifies either the slot number or the slot and port number.

dspportstats

Displays a summary of port statistics for the ATM port specified. These include the cell count in the transmit and receive directions, and error counts associated with the port. The display indicates the date and time that the statistics were cleared and the statistics collection time since the last clearance. Cells transmitted indicates the amount of data transmitted out the port to the user device. Cells received indicates the amount of data received from the user device at the port. Corrupted statistics result from channel/port loopbacks or port tests. A yes in this field indicates that such loopback or port test have occurred since the statistics were last cleared.

Full Name

Display port statistics

Syntax

Hit DEL key to quit:

Table 10-34 dspportstats – Parameters

Parameter	Description
slot.port	Specifies the ATM card set and port number.

Table 10-35 dspportstats – Optional Parameters

Parameter	Description
interval	Specifies the refresh interval time for data. It can be specified between 1 and 60 seconds. The default interval is 1 seconds.

grpcon

Adds a connection to a group. Adding a connection to a group has two prerequisites:

- The connection must already exist on the node (see the **addcon** command).
- The connection group must already exist (see the **addcongrp** command).

No command exists to delete an individual connection from a group. Instead, the connection must be deleted (using **delcon**) then added again. The **grpcon** command can be used to add either a single connection or multiple connections. Using the optional *channel ... channel* parameter format, a range of 1 - 16 connections can be added to the group in one command. All connections in the group must be of the inter-node, non-bundled ATM type. They must also have the same endpoints, routing characteristics, and ForeSight enable status.

The first connection added to a group determines the routing characteristics of the entire group. All subsequent connections must match the first connection's characteristics of ownership, COS, routing state, routing restrictions, and ForeSight. Attempting to add a dissimilar connection results in an error message "mismatched connection/group" characteristic. For example, the ownership of both the connection group and the connection itself must be either local or remote. Non-connection parameters, such as fail state, loop state, and configuration, can be specified for an individual connection in the group after the connection has been added to the group.

Full Name

Group a connection

Syntax

grpcon <connection group> <channel> [channel... channel]

Related Commands

delcongrp, addcongrp, dspcongrps, dspcongrp

Attributes

Privilege	1-2
Jobs	Yes
Log	Yes
Node	IPX, IGX, BPX
Lock	Yes

Example 1

grpcon bpx6.1 9.1.100.100

Description

Establish a connection group to BPX6 for connection 9.1.100.100.

System Response

```

bpx1          TN      StrataCom      BPX 15      8.2      Feb. 14 1996 20:00 PST

Local         Remote   Remote
Channel       NodeName  Channel      State  Type      Route
9.1.100.100   bpx6      11.2.100.100 Ok     vbr       Avoid COS 0
                                     0  L

```

This Command: grpcon bpx6.1 9.1.100.100

Group these connections (y/n)?

Table 10-36 **grpcon – Parameters**

Parameter	Description
connection group	The name of the connection group that has been established on the local node.
channel	The local node channel to be added to the group in the format <i>slot.port.vpi.vci</i> .

Table 10-37 **grpcon – Optional Parameters**

Parameter	Description
.chan ... chan	Specifies a contiguous range of up to 16 connections to add to the group at once.

prtlns

Prints the current line configuration and line alarm status for a node. This command uses the same syntax and prints the same information as is displayed using the **dsplns** command. See the **dsplns** command for syntax and output information.

Full Name

Print lines

Syntax

prtlns

Related Commands

upln, dnln

Attributes

Privilege	1–6
Jobs	Yes
Log	No
Node	BPX
Lock	No

Example 1

prtlns

Description

This command uses the same syntax and prints the same information as is displayed using the **dsplns** command. See the **dsplns** command for syntax and output information.

upln

Activates (ups) a line. This command makes the line available for configuring and causes statistics gathering to begin. Connections may now be added with the **addcon** command. Line activation may be verified using the **dsplns** command.

Full Name

Up line

Syntax

```
upln <slot.port>
```

Related Commands

dnln, dsplns

Attributes

Privilege	1–2
Jobs	Yes
Log	Yes
Node	BPX
Lock	Yes

Example 1

```
upln 4.2
```

Description

Activate line 4.2

System Response

```
ca19          VT    StrataCom      BPX 15      8.2      Mar. 23 1996 19:08 GMT

Line Type      Current Line Alarm Status
4.1 T3         Clear - OK
4.2 T3         Clear - OK
```

Last Command: upln 4.2F

Next Command:

Table 10-38 **upln – Parameters**

Parameter	Description
slot. port	Specifies the shelf slot number, and one of the ports.

upport

Activates a single port on an ASI. If the port has not been configured, the default configuration values are used to configure the port.

Full Name

Up port

Syntax

upport <slot.port>

Related Commands

dnport, cnfport, upln

Attributes

Privilege	1–2
Jobs	Yes
Log	Yes
Node	BPX
Lock	Yes

Example 1

upport 4.2

Description

Activate port 2 on the ASI in slot 4

System Response

```
ca19          VT      StrataCom      BPX 15      8.2      Mar. 23 1996 19:17 GMT
